NOTE: Delayed data and corrections will be carried in the June and December issues of this publication. An explanatory page "Description of Charts" will be carried in the January and July issues.

SUBSCRIPTION PRICE: Monthly 20 cents and annual 40 cents per copy; yearly subscription, including monthly and annual issues, $2.50 domestic, $3.50 foreign. Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to "Superintendent of Documents, Government Printing Office, Washington, D.C. 20402"

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 22 No. 1 JANUARY 1971

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Bone-chilling cold prevailed during most of January from the northern Great Plains to New England.
2. Record warmth occurred at some points in the Southwest and in the Florida Peninsula.
3. Deep snow accumulated in the Cascades.

TEMPERATURE.--January was named for the ancient Roman god, Janus, who had two faces. A happy face looked one direction, a sad face looked the opposite direction. Weatherwise, January 1971 was as two-faced as Janus.

Cold weather prevailed over the West and East early in the month but unusual warmth occurred over southern Texas where Cotulla registered 96° on January 3. This is only 2° cooler than the highest temperature of record for any spot in the Nation. Fort McIntosh, Tex., registered 98° on January 18, 1914, and Laredo, Tex., recorded 98° on January 17, 1936. Cold air plunged southward behind a storm centered over Lake Michigan. In about 18 hours, from the afternoon of January 3 to the following morning, the temperature at Cotulla plunged 60° from 96° to 36°. Flagstaff, Ariz., registered 22° below zero Monday morning, January 4. By Tuesday morning, January 5, arctic air covered the West from Canada to Mexico and on Wednesday morning subzero weather was common from the northern Rocky Mountains to southern New Mexico and northeastward to Lakes Superior and Michigan.

On January 5, the temperature at Rock Springs, Wyo., went no higher than 18° below zero and on the 7th, Fraser, Colo., registered 42° below zero and the mercury at Albuquerque plunged to 17° below zero. This is the coldest temperature of record for Albuquerque. Other cold temperature readings included 47° below zero at Antero Reservoir, Colo., and some unofficial readings of -50° or colder. The minimum temperatures at Moline, Ill., on January 6 and 7 were -13° and -17°, respectively.

Cold weather continued over most of the Nation for several days. New York and New England registered subzero temperatures on 1 or 2 mornings; -25° at Massena, N. Y., on the 9th. Some warming occurred in the central Great Plains. Missouri warmed to the 40's on the 9th which is about normal for early January. Mild weather continued in the Florida Peninsula.

Bone-chilling cold continued from Montana to New England at midmonth while near-record warmth occurred over portions of the South. On January 18, the temperature at Los Angeles, Calif., climbed to 95°. This is 5° warmer than the previous January record for Los Angeles and only 3° cooler than the January record for any spot in the United States. On the 19th, the temperature at Phoenix and Yuma, Ariz., reached 88° setting new January high-temperature records for those localities.

At the other extreme, cold arctic air plunged southward over the central and eastern portions of the Country. Bemidji, Minn., registered 31° below zero and Houlton, Maine, 35° below zero on the same date that Phoenix and Yuma recorded their record-high January readings. The bitter cold pushed far southward over the eastern part of the Nation with subfreezing temperatures occurring in the Florida Everglades January 20 and 21. Meanwhile, southerly winds warmed the Great Plains. On the afternoon of the 20th, Rapid City, S. Dak., and Valentine, Nebr., were as warm as Orlando, Fla. The maximum at each station was 47°. On the 21st, the temperature at Tallahassee, Fla., dropped to 32° which was 11° colder than Fargo, N. Dak. Pueblo, Colo., warmed to 78°, a new January record.

Arctic air poured into the north-central States in the last week of January. It then spread eastward and southward. As the end of the month approached, subzero weather plunged as far south as central Illinois while record-breaking warmth covered parts of Washington, Oregon and southern Texas.

PRECIPITATION.--A giant storm developed in the Southwest early January 2. It intensified as it moved into the southern Great Plains and spread heavy snow from the Rocky Mountains across the northern and central Great Plains to the Great Lakes. Mixtures of freezing rain and sleet fell east and south of the snow belt. Rain and scattered thunderstorms occurred farther south. In the snow belt, snow depths reached 12 to 17 inches from the Colorado Rockies across Nebraska and Iowa to northern Illinois. Moline, Ill., received 16.4 inches of snow on January 3. This is the greatest 24-hour snowfall of record for Moline. LaCrosse, Wis., set a 24-hour snowfall record when 16 inches fell there. Strong winds drifted the snow badly. Numerous roads became blocked. The care of livestock became extremely difficult.

Early in the 2d week of January, a storm developed over the Gulf of Mexico. It dumped several inches of snow over the northern portions of Mississippi and Alabama. Another storm brought wet and windy weather to the Pacific Northwest. Rain fell along the coast with snow in the mountains and eastward to the northern Great Plains. By the evening of January 9, 15 inches of new snow covered Lincoln, Mont., near the Continental Divide. Freezing rain slicked the highways in parts of Oregon and Idaho. Another storm brought freezing rain from northern Louisiana to Virginia and rain southward to the Gulf coast. The freezing rain made highway driving treacherous. Ice accumulated on trees, poles, and wires. Limbs and wires broke. Electric service in the Athens, Ga., vicinity was interrupted for 12 hours.

On January 13, a front extended from the north-central states to the Carolinas with miserable weather on both sides of it. Snow fell in the Northern States and sleet, freezing rain, or freezing drizzle with fog, occurred south of the snow belt. By the 14th, a large area from Illinois to the Northern and Middle Atlantic States had become coated with a layer of ice that made walking or driving risky. Shortly after midmonth, an intense storm off the Pacific coast brought heavy precipitation and strong winds to the Northwest. After gusting to 109 m.p.h. at Cape Blanco, Oreg., late on the 15th, the winds slackened some but by the 17th, another storm was pounding the Pacific coast with winds up to 70 m.p.h.

More storms occurred in the last week of January. Stampede Pass, Wash., received 75 inches of snow in 3 days, January 22 to 24. This is the most that ever fell at Stampede Pass in 3 days. Eighty-eight inches of

new snow fell at Paradise Ranger Station, Wash., on the south side of Mt. Rainier in the same 3 days bringing their snow depth to 232 inches. A massive storm spread miserable weather from the Great Plains to New England. Strong winds, accompanied by heavy snow and poor visibility made automobile travel impossible in some places and extremely hazardous in many others. Thunderstorms occurred along the Atlantic coast and dense fog covered parts of the Deep South.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.
V Sun below horizon November 19 - 30, inclusive.
X Sun below horizon November 24 - 30, inclusive.

Data from airport unless specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

V Sun below horizon November 19 - 30, inclusive.
X Sun below horizon November 24 - 30, inclusive.

° Includes crop damage
C Crop damage
* No occurrence of storms or unusual weather phenomena reported.
‡ Includes heavy sleet storm
Freezing drizzle and freezing rain, commonly known as glaze
Ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5,000,000
7 $5,000,000 to $50,000,000
8 $50,000,000 to $500,000,000
9 $500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS
JANUARY 1971

Elmer R. Nelson, Office of Hydrology

Major flooding occurred in western Oregon during January. The most severe flooding occurred on the Coquille River which remained above flood stage for 5-days. The Geological Survey reported that the peak discharges of some streams were the highest for January in more than 60 years. In southwestern Washington, the Chehalis River at Grand Mound was the 3d highest since 1928.

Extreme low temperatures caused several ice jams and minor flooding on the Kenai River near Cooper Landing, Alaska, on Jan. 11-15. The accumulation of snow in the Fairbanks, Alaska, area at the end of the month totalled 39 inches with water equivalent of nearly 7 inches.

HUDSON BAY DRAINAGE

Red River of the North Basin.--River stages in the Red River of the North Basin were near seasonal normal during the month of January. All rivers were ice covered, except near sewer or industrial discharge outlets. Most smaller tributaries were frozen solid.

The snow depth over the Red River of the North Basin averaged 14 inches and 11 inches over the Souris Basin. The heaviest snow cover was in the upper reaches of the Red Lake River where average snow depths ranged from 20 to 28 inches. Average snow depths in the Pembina Basin ranged from 12 to 20 inches. The water equivalent of the snow pack in the Souris Basin averaged 1.5 inches at the end of the month. The soil was frozen to depths greater than 36 inches over most sections of the basin.

ATLANTIC SLOPE DRAINAGE

Heavy rainfall (1 to 2 inches) during the afternoon and evening of the 4th caused flooding on the Neuse River at Smithfield, N. C., and on the lower Cape Fear on the 6-9th. Rainfall amounts in the headwater areas ranged locally up to 2.5 inches. No damage resulted from the overflows.

There were two rises on the Lumber River at Lumberton, N. C. The first rise occurred on the 16th-22d and the second on the 30th which continued into February. Moderate lowland flooding occurred on the Pee Dee River from below Blewett Lake to Cheraw, S. C. Flood stage was reached at Peedee, S. C., on the 13th. The overflows were due to rainfall that averaged 1 inch on the 8-9th and on the 25-26th. Flood damages along the Pee Dee River were estimated at $4,000 and were due to the cost of moving logging machinery from the lowlands. Flood damages along the Lumber River were minor.

Heavy rainfall on the 24-26th in the Savannah Basin caused moderate flooding on Stevens Creek at Modoc, S. C., on the 26-27th. Slight to moderate damage resulted from the overflow.

EAST GULF OF MEXICO DRAINAGE

The Apalachicola River at Blountstown, Fla., was out of its banks on the 6-15th. The crest on the 8th was almost 3 ft. above flood stage. Wooded and unpopulated areas not susceptible to much damage were flooded.

Moderate rains in the headwaters of the Tombigbee Basin caused minor flooding at Fulton and Aberdeen, Miss., between the 24th and 27th. No damage resulted.

Moderate to heavy rainfall during the last few days of December produced rising stages on the Pearl River during the first week of January. Discharges from Ross Barnett Reservoir raised the Pearl River to slightly above flood stage at Jackson, Miss., on the 3d-5th. Flooding was confined to the immediate vicinity of the river and was of little consequence. Local rains caused flooding at Bogalusa, La., during the first 10 days of the month and again during the last few days of January. Flooding was confined to low-lying farm and timber lands adjacent to the river and was of little consequence.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--Precipitation during January in Minnesota and Wisconsin was above normal except in the Minnesota River Basin above Mankato, Minn. In most areas, the precipitation was twice the amount received during December. The water equivalent of the snow that fell during January ranged from 1 inch in west-central Minnesota to 2.5 to 3 inches over central and eastern Wisconsin. The snowfall during January on the south shore of Lake Superior ranged in depth from 32 inches to over 50 inches in the Gurney-Hurley, Wisconsin, area.

Locally heavy rains of 1 to 1.5 inches on the 3d-4th caused a slight overflow of the Salt River at New London, Mo. No significant damage was reported.

Missouri Basin.--Some minor flooding occurred along lowland areas on the Gallatin River in Montana on the 12-15th due to ice jams. The ice jammed for about 30 miles between Toston and Logan, Mont., causing minor damage.

Heavy rain or rain and snow mixed on the 3d and 4th caused 3 to 8 ft. of flooding on several streams in northwestern Missouri. Precipitation amounts ranged from 1.5 to slightly over 2 inches. Heavy snow fell just north of the Kansas City, Mo., area eastward into central Missouri and to the north of this line. Snowfall measured from 4 to 8 inches over most of northwest and north-central Missouri and from 10 to 16 inches over extreme northeast Kansas, southeast Nebraska and southwest and south-central Iowa. No significant damage resulted from the flooding.

Heavy precipitation (1.5 to 2.5 inches) on the Marais des Cygnes and 2 to 3 inches on the Marmaton on the 2d-3d produced substantial rises on these streams. One to 3 foot overflows occurred on Pottawatomie Creek and on the Marais des Cygnes from Osawatomie, Kans., downstream from the 4th to the 7th. The flooding was brief and caused no crop losses. Livestock in low lying pastures were either moved or water was not deep enough to cause losses.

Some minor flooding occurred along the upper Missouri River in Montana on the 12-15th due to ice jams. In the reach at and below Sioux City, Iowa, ice action caused a rise of over 10 ft. at Sioux City. The high water and ice caused some damage to low docks and boats. Ice bridges remained during the entire month in the Leavenworth, Kans. - St. Joseph, Mo., areas and northward. Occasional ice bridges occurred from around the Kansas City area to several miles downstream.

Ohio Basin.--Heavy snowfall occurred over most of the Monongahela Basin on Dec. 31 to Jan. 1. Totals of 12 inches or more covered the Cheat, Tygart and upper Youghiogheny and West Fork Rivers. The largest amounts were 26 inches at Thomas and Alpena, W. Va., in the headwaters of the Cheat River. Heavy rains on the 4th and 5th melted most of the snow cover except in the Cheat Basin where 6 inches of snow remained. Minor flooding occurred on the West Fork at Weston and Clarksburg, W. Va., and on the Tygart River at Philippi, W. Va. The lower Mononghela River in Pennsyl-

vania exceeded flood stage by 1 foot or less. This was about the same level as in December. No significant damage resulted from the overflows.

Heavy rain on the 4th and 5th caused flooding in the headwater areas of the Little Kanawha River and Twelvepole Creek in West Virginia. Some overflow occurred on Point Creek near Paintsville, W. Va. Some highways were cut off by the high water.

Heavy rains on the 2d-3d and on the 13-14th caused up to 2 ft. of flooding on the Muscatatuck River at Austin, Ind. No damage resulted from the overflows on the 5th and 14-16th.

The main stem of the Ohio River at Fords Ferry, Ky., continued in flood from Dec. 27 to Jan. 1.

White Basin.--Heavy rain on the 13-14th caused the Black River at Black Rock, Ark., to rise rapidly above flood stage on the 14th. It crested on the 15th 3.7 ft. above flood stage and receded within its banks on the 19th.

The Cache River at Patterson, Ark., continued above flood stage from Dec. 19 through January.

The White River rose to flood stage at Clarendon, Ark., on Dec. 31 to Jan. 2 and again on Jan. 14-15.

No damage resulted from the flooding in the White Basin during January.

Arkansas Basin.--Minor lowland flooding occurred on the Neosho River at Commerce, Okla., on the 5-6th. This overflow was due to over 2 inches of rain on the 3d.

Lower Mississippi Basin.--Locally heavy rains at mid-month resulted in slight lowland flooding on the St. Francis River in the St. Francis, Ark., reach on the 16th - 20th. No damage resulted from this rise.

PACIFIC SLOPE DRAINAGE

Sacramento Basin.--One major storm period, with precipitation beginning about the 12th and continuing through the 18th, produced a major rise on the upper Sacramento River on the 16-17th. Flood stage was exceeded at Tehama Bridge and Vina, Calif., just above Hamilton City, and warning stages were exceeded from Ord Ferry to Fremont, Calif. Overflow into the Sutter Bypass began on the 17th and continued through January. Overflow into the Yolo Bypass began on the 19th and continued through the 29th with flooding of the lower tracts. Runoff in the Feather-Yuba River System was effectively controlled by the Oroville and New Bullards Bar reservoir systems.

Central Coastal Basins.--Heavy precipitation on the 10-18th, totalling 15.5 inches in the Smith Basin and 10.4 inches in the Eel Basin, caused overflow in these basins on the 16-18th. The Eel River at Fernbridge, Calif., rose steadily to 2 ft. above flood stage on the 17th. There were two periods of overflow on the Smith River near Crescent City, Calif., and Fort Dick River, Calif. The first rise occurred on the 16-17th and the second on the 17-18th. The major effect of the overflows was the temporary dislocation of persons and livestock and the deposit of silt and debris over the inundated areas. Moderate to heavy damage occurred to roads and highways from mud slides due to the heavy precipitation.

Coastal streams in southwestern Oregon rose out of their banks during the period from the 15th to the 20th. Snowfall from the 11th to the 14th blanketed all of southwestern Oregon with 6 to 12 inches of snow in the valleys and 2 to 3 ft. in the foothills. A warm rain beginning on the 15th was reported up to the 10,000 foot level by the evening of the 16th. The warm rains decreased the snowpack at Crater Lake Park Headquarters by 20 inches on the 17th and 18th. The resulting runoff triggered general flooding west of the Cascade Mountains. The most severe flooding occurred on the Coquille River, which remained above flood stage for 5 days. The crest at Myrtle Point, Oreg., on the 17th was 9.5 ft. above flood stage. Flood waters affected the Rogue and Umpqua Rivers on the 17-18th with crests 5 to 10 ft. above flood stage. Damage due to the high water was confined mostly to siltation and debris.

Columbia Basin.--Runoff over the Snake River Basin during January ranged from higher than average to record high over most of the basin. Warm rains near mid-month caused considerable snowmelt along small streams at low elevations in the southwest valleys and in the central plains area of southern Idaho. Rain and snowmelt in the central plains area of south Idaho accumulated as it flowed over frozen surface ground. This resulted in flooding of farmlands, in the lower areas, and the filling of many residential basements. Damage was primarily due to ice jamming and plugging drainage facilities that soon became inadequate, causing the runoff to pond. Extreme runoff occurred over the lower drainage areas of the Owyhee River above the reservoir. The Portneuf River at Pocatello, Idaho, was above flood stage on the 8-16th due to ice plugging the channel at and for a mile below the gaging station. The Weiser River near Weiser, Idaho, was out of its banks on the 15-16th due to ice blocking the channel. Earlier flooding in the vicinity of Montour, Idaho, along the Payette River below the Horseshoe Bend gaging station was due to an ice jam in the channel. The main damage from the flooding occurred in this area. The total damages in Washington and Cassia Counties, Idaho, were estimated at $235,000.

The flooding in the Willamette Basin streams during the first few days of January was due to a series of storms during the last 4 days of December. All streams crested on Dec. 31 except the Tualatin at Farmington, Oreg., which crested on Jan. 2 nearly 2 ft. above flood stage. All streams continued falling until the weekend of Jan. 8-10 when a series of storms brought 0.5 to 0.75 inches of precipitation to Willamette valley stations. In the local Portland area, Johnson Creek crested 0.5 ft. over bankfull stage late on the 8th with a second peak nearly as high on the morning of the 10th. Primarily because of the low freezing levels, other streams in the Willamette Basin responded only slightly.

During the period from the 11th to the 14th, an outbreak of windy, snowy weather brought 6 to 12 inch snowfall amounts in the Willamette Valley. A flow of warm, moist air from low latitudes beginning on the 15th caused the freezing levels to rise to the 8 to 10 thousand foot levels both west and east of the Cascade mountains. Rainfall totalled about 6 inches at valley stations during the period from the 15th to the 20th. This rain, coupled with warm weather, melted the snow cover on the valley floor up to elevations near 3,500 feet. The Willamette tributaries which head in the Coast Range, rose to above flood stage on the 15-17th. Crests ranged up to 5 ft. above flood stage on the South Yamhill at Whiteson, Oreg., on the 16th. Local creeks in the Portland, Oreg., area had their highest crests from the rainfall-snowmelt runoff on the 15-16th. The more sluggish drainages, the Tualatin and Pudding Rivers, reached their crests on the 19-20th. The main stem of the Willamette rose above flood stage at Harrisburg and Oregon City, Oreg., on the 18-19th. The crests ranged up to 3.6 ft. above flood stage at Oregon City on the 19th.

Coast Range Willamette tributaries had secondary

rises and crests over flood stage during the last week of the month. The crests were lower than those observed earlier as the heavier precipitation occurred along the coastal sections of extreme northwest Oregon. The Nehalem and Wilson River drainages received close to 8 inches of rainfall. The Nehalem River at Foss, Oreg., crested 6.4 ft. above flood stage.

The Corps of Engineers estimated damages in the Willamette, lower Columbia and Oregon Coastal Basins at about $1.6 million. Damages from a flash flood on Pataha Creek at Pomeroy, Wash., on the 9th were estimated at nearly $0.5 million.

Northern Coastal Basins.--Minor flooding occurred in the Chehalis Basin on Dec. 31 to Jan. 1, moderate flooding on the 16-20th and severe flooding on the 25-28th. The first overflow was due to heavy rain; the second and 3d overflows to rain and snowmelt. The 3d flood was the most severe since 1937. The peak flow of 40,100 c.f.s. at the Grand Mound, Wash., USGS gage was the 3d highest on record. It flooded considerable farmland, numerous roads, many homes and a number of motels and business establishments. Preliminary damage estimates by the Corps of Engineers were placed at $1 million.

The Snohomish River exceeded flood stage 3 times during the month. The first flood on the 19-20th was the highest with a crest 3.2 ft. above flood stage. The causes of the overflows were heavy rain and snowmelt. Only minor damage resulted as the dikes held.

Serious flooding occurred on the Nooksack River at Deming, Wash., on the 30th-31st. This overflow was due to warm rains of 2 to 4 inches in 24 hours plus rapid snowmelt. Heavy antecedent snowfall had built up a deep snowpack over the upper basin. Temperatures rose to the upper 40's in the upper reaches and to the 50's in the lowlands. Flash flooding in the upper reaches washed out two bridges above Deming, Wash., and stranded some 200 skiers on Mount Baker overnight. The river crested 2 ft. above flood stage at Deming on the 30th.

Shallow flooding occurred the length of the flood plain. Some 150 people were evacuated from their homes near Marietta. Preliminary estimates of flood damages were placed at $200,000.

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

\+ Observations for these stations are scheduled at 0000 G. C. T.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun.

Note. --Langley is the unit used to denote one gram calorie per square centimeter.
Values with an asterisk are interpolated.

U Indicates Urban sites.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

NET RADIATION

Net radiation in langleys per day (6 A. M. to 6 P. M.) AT PALMER, ALASKA

[illegible] 1971

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	-31	- 5	-29	-12	-12	-28	- 6	-175	-142	-101	-88	-119	-188	-179	-189	-123	-1[illegible]	-75	-62	- 9	-74	-2[illegible]	-9[illegible]	-98	-[illegible]	- 7	-[illegible]	-[illegible]	-[illegible]	-22	-3[illegible]	-79

The measurement is made with a [illegible] net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (3900 Å) at Ames, Iowa.

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	6.41	4.44	1.57	8.29	8.29	8.29	7.99	7.40	6.11	7.30	7.30	6.81	3.75	8.35	8.58	7.11	6.23	7.59	8.29	7.13	8.24	8.48	8.40	8.[illegible]	7.[illegible]	8.[illegible]	6.[illegible]	7.58	7.71	[illegible]	8.[illegible]	[illegible]

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code $\lambda s \, Q \, Q \, Q$ defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

The spectrophotometer measures the total amount of ozone in the atmosphere, i e , the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded $Q \, Q \, Q$) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e g , 350 milli-atmo-cm ozone implies an ozone layer 0 350 centimeter thick. The code λs designates the type of measurement made.

DESCRIPTION OF CHARTS

CHART I. A. NORMAL DAILY AVERAGE TEMPERATURE (°F. 1931-60) FOR MONTH. B. TEMPERATURE DEPARTURE FROM 30-YEAR MEAN (°F. 1931-60) FOR MONTH. Chart I-A is reproduced from Environmental Data Service Publication "Climatic Maps of the United States". Chart I-B is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin", a publication of Environmental Data Service.

CHART II. TOTAL PRECIPITATION. Chart II is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin".

CHART III. PRECENTAGE OF NORMAL PRECIPITATION. Chart III is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin".

CHART IV. TOTAL SNOWFALL. CHART V. A. PERCENTAGE OF MEAN MONTHLY SNOWFALL. B. DEPTH OF SNOW ON GROUND. Chart IV gives the total depth in inches of unmelted snowfall as reported during the month by Weather Bureau and selected cooperative stations. This is converted in Chart V-A into a percentage of the mean monthly total amount computed for each Weather Bureau station having at least 10 years of record. The depth of snow on ground is that reported by both Weather Bureau and selected cooperative stations as of 7:00 a.m. Eastern Standard Time on the Monday nearest the end of the month. This is reported only for the months December through March. The snowfall charts are presented each month November through April.

Isolines for Charts I, II, III, IV, and V, are drawn through points of approximately equal value. Caution should be used in interpolating on these charts, particularly in mountainous areas.

CHART VI. A. PERCENTAGE OF POSSIBLE SUNSHINE. B. PERCENTAGE OF MEAN MONTHLY SUNSHINE. Chart VI-A shows the amount of sunshine received in terms of percentage of the total hours of sunshine possible during the month. In Chart VI-B this is shown as a percentage of the mean number of hours of sunshine received. Means are computed for Weather Bureau stations having at least 10 years of record.

CHART VII. A. AVERAGE DAILY VALUES OF SOLAR RADIATION LANGLEYS. B. PERCENTAGE OF MEAN DAILY SOLAR RADIATION. Shown on Chart VII-A are the monthly averages of daily total solar radiation, both direct and diffuse, in langleys (gm. cal. cm.-2) for all Weather Bureau and selected cooperative stations which record this element. The analyses include adjustments required to bring station records to approximately the same level of calibration. Adjusted numbers are in parentheses. Chart VII-B shows the percentages of the mean based on at least 5 years of record during the period 1950-1960, and corrected to the International Pyrheliometer Scale of 1956.

CHART VIII. TRACKS OF CENTERS OF ANTICYCLONES AT SEA LEVEL.

CHART IX. TRACKS OF CENTERS OF CYCLONES AT SEA LEVEL. Centers which can be identified for 24 hours or more are tracked in these charts. Semi-permanent features such as the Great Basin and Pacific Highs and Colorado and Mexico Lows are not shown. The 7:00 a.m. EST positions are shown by open circles, with the intermediate positions at 6-hour intervals shown by solid dots. The date is given above the circle and the central pressure to whole millibars below. A dashed track indicates a regeneration rather than actual movement to the next position. Solid squares indicate position of stationary center for period shown beside it.

CHART X. AVERAGE SEA LEVEL PRESSURE (mb.) AND RESULTANT SURFACE WIND. The average monthly sea level pressures are obtained from eight daily 3-hourly observations reported at Weather Bureau Stations. Resultant surface wind directions (to 36 points of the compass) for the month are shown by arrows. Resultant speeds are in miles per hour and are indicated by the length of arrow shafts. Constancy ratios (resultant surface wind divided by average surface wind for month) are shown to two decimal places. The inset shows the departure of the average pressure based on 30-year normals for first-order Weather Bureau Stations, other stations having at least 10 years of record; and for each 10° intersection in a diamond grid over the oceans.

CHARTS XI-XVI. AVERAGE HEIGHT, TEMPERATURE, AND RESULTANT WINDS, 850, 700, 500, 300, 200, and 100 mb. Height is given in geopotential meters and temperature in degrees Celsius. These are the averages of the 1200 GMT radiosonde reports. Wind speeds are given in meters per second; flag represents 25 m.p.s., full feather 5 m.p.s., and half feather 2 1/2 m.p.s. Directions are shown to 360° of the compass. Winds are based on rawins at the indicated pressure surface and at 1200 GMT.

CHART XVII. A. 50-MB. RESULTANT WINDS. B. 30-MB. RESULTANT WINDS. Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. Winds are based on rawins at the indicated pressure surface and at 1200 GMT.

Exact values of most of these charted elements for Weather Bureau stations are printed each month in tabular form in CLIMATOLOGICAL DATA, NATIONAL SUMMARY. Extreme values of temperature and precipitation for each state are included in the tables, Condensed Climatological Summary. Annual averages for surface elements are presented in the CDNS Annual Issue each year.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), January

B. Temperature Departure from 30 - Year Mean (°F 1931-60), January 1971

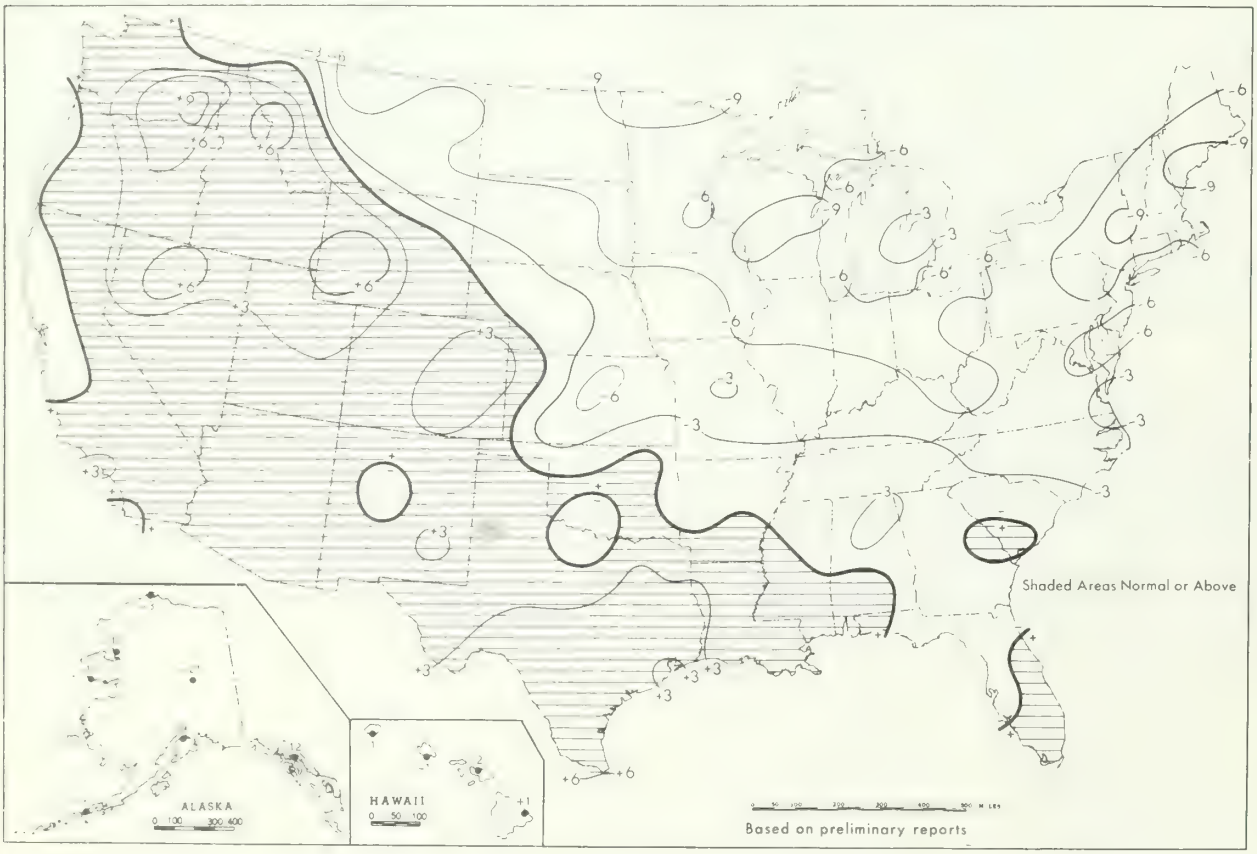

Chart II. Total Precipitation (Inches), **January 1971**

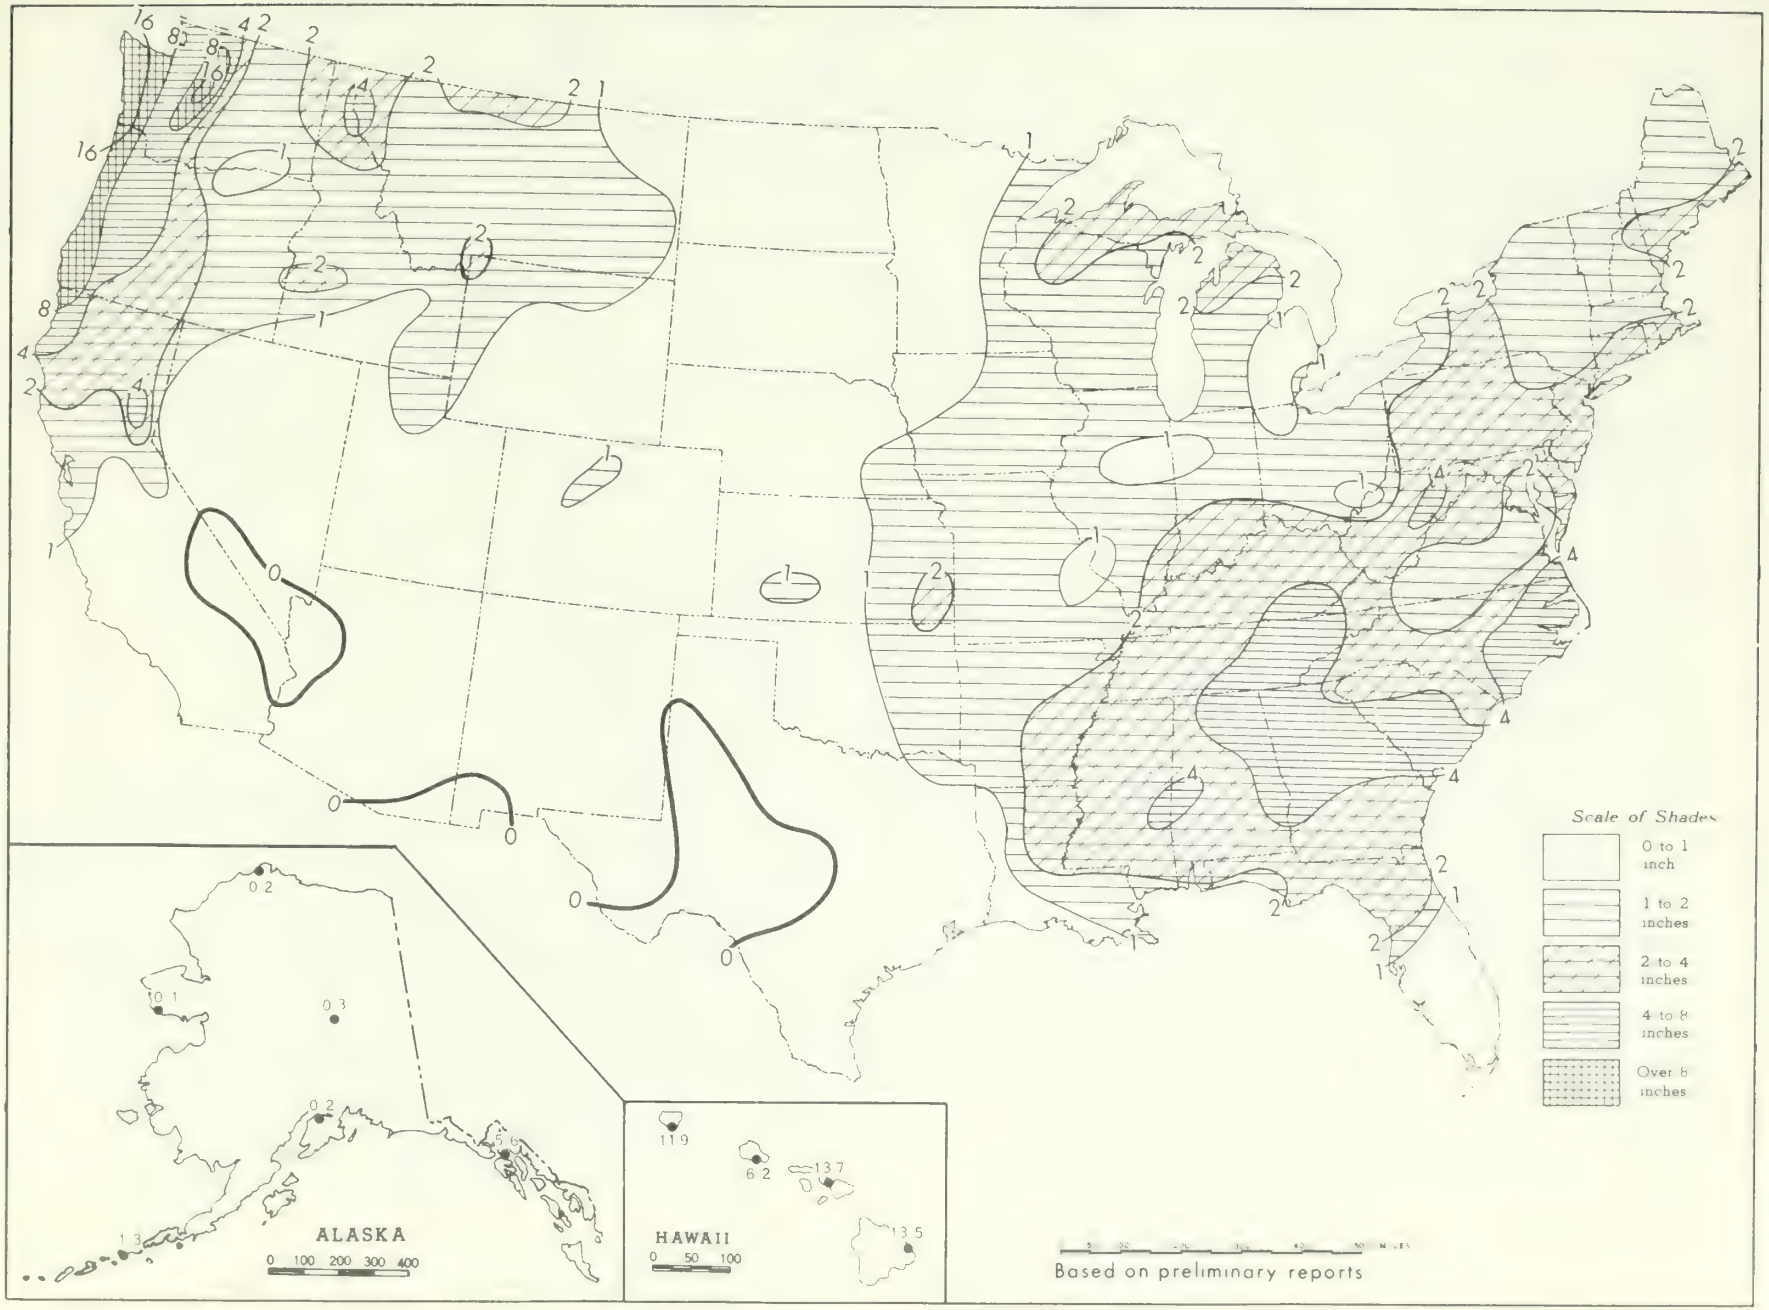

Chart III. Percentage of Normal Precipitation, January 1971

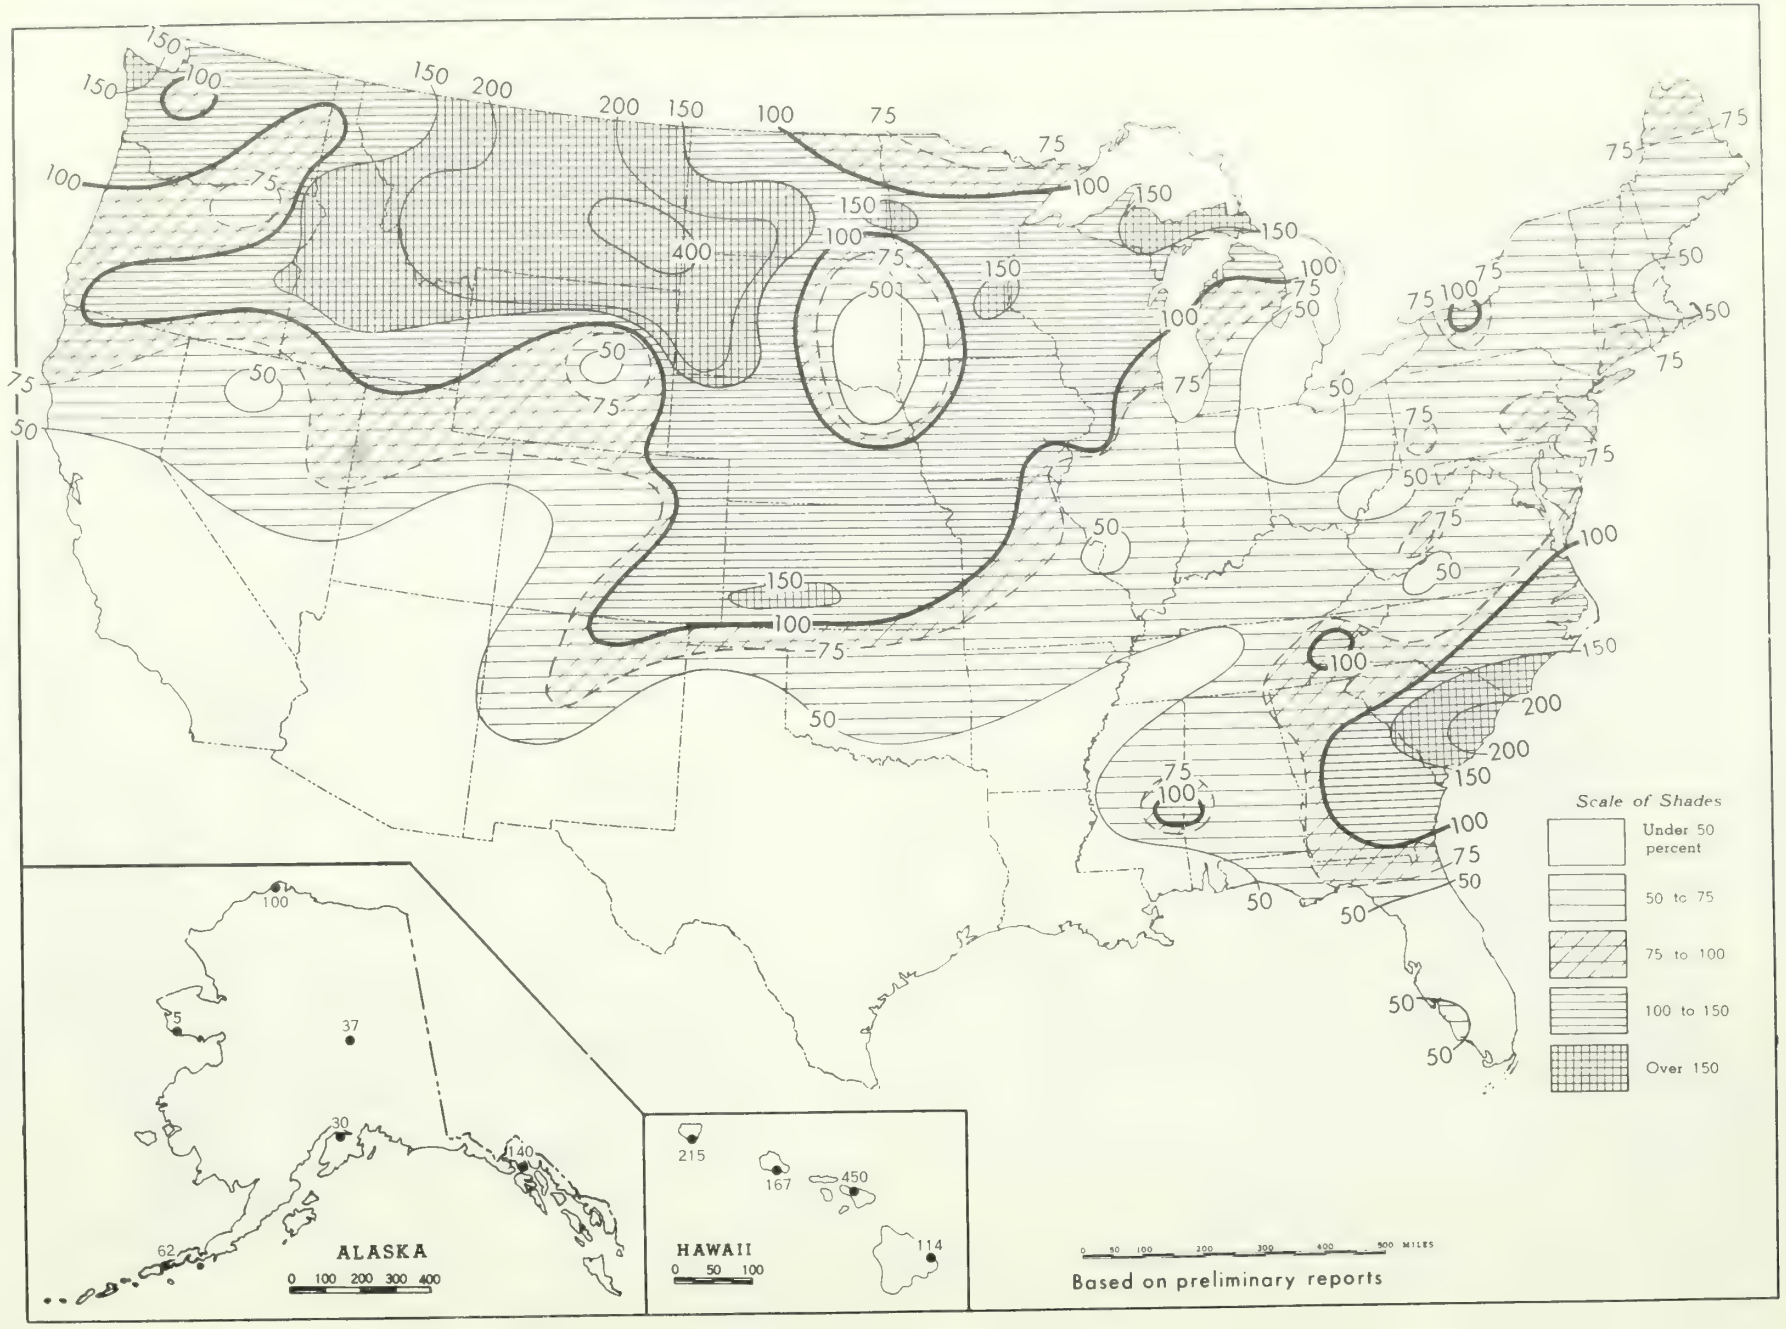

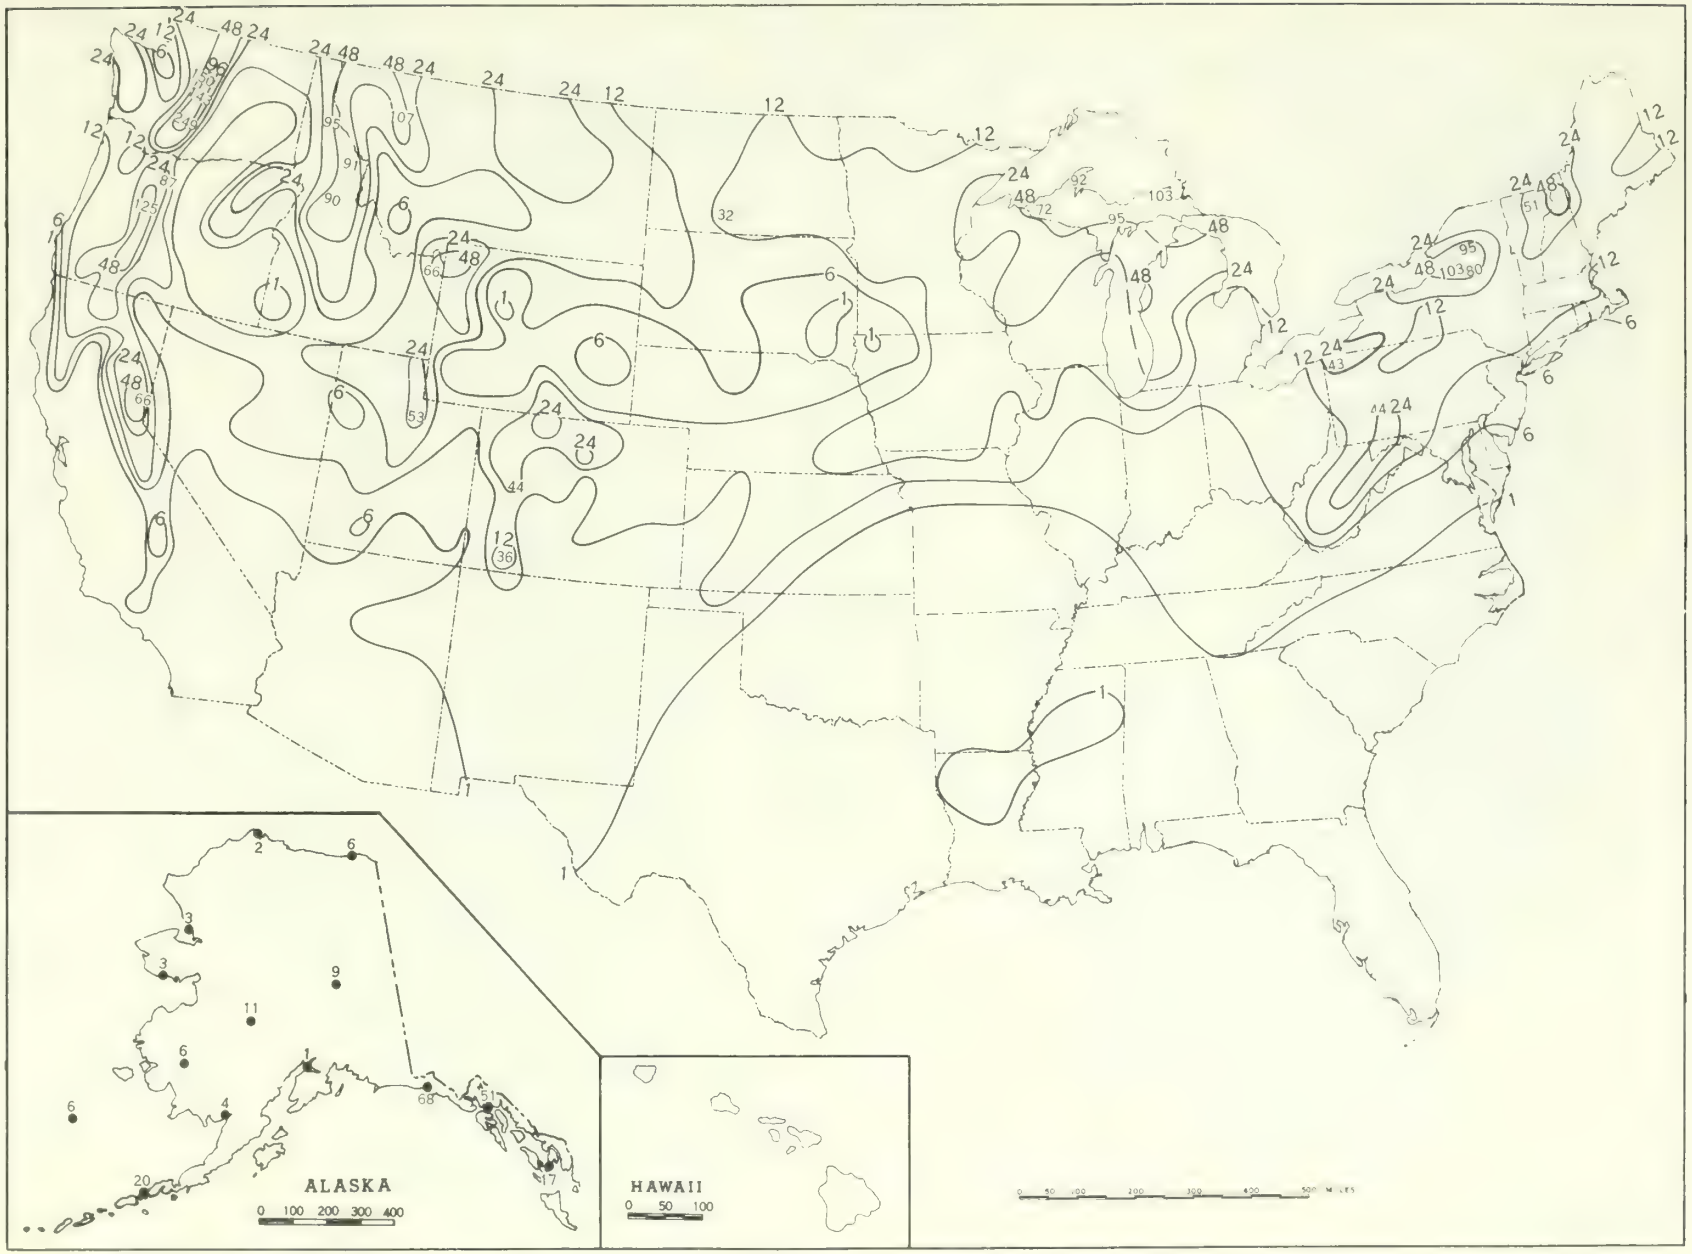

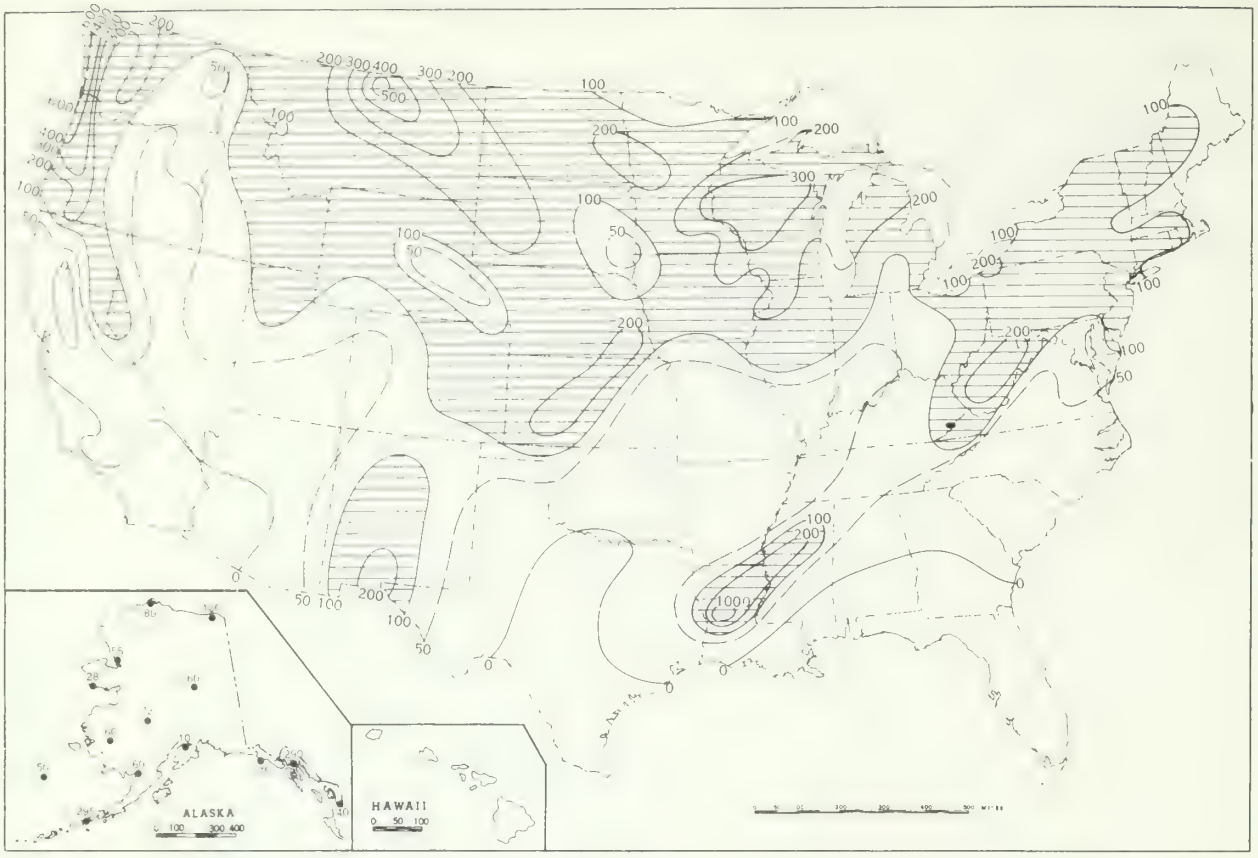

Chart IV. Total Snowfall (Inches), January 1971

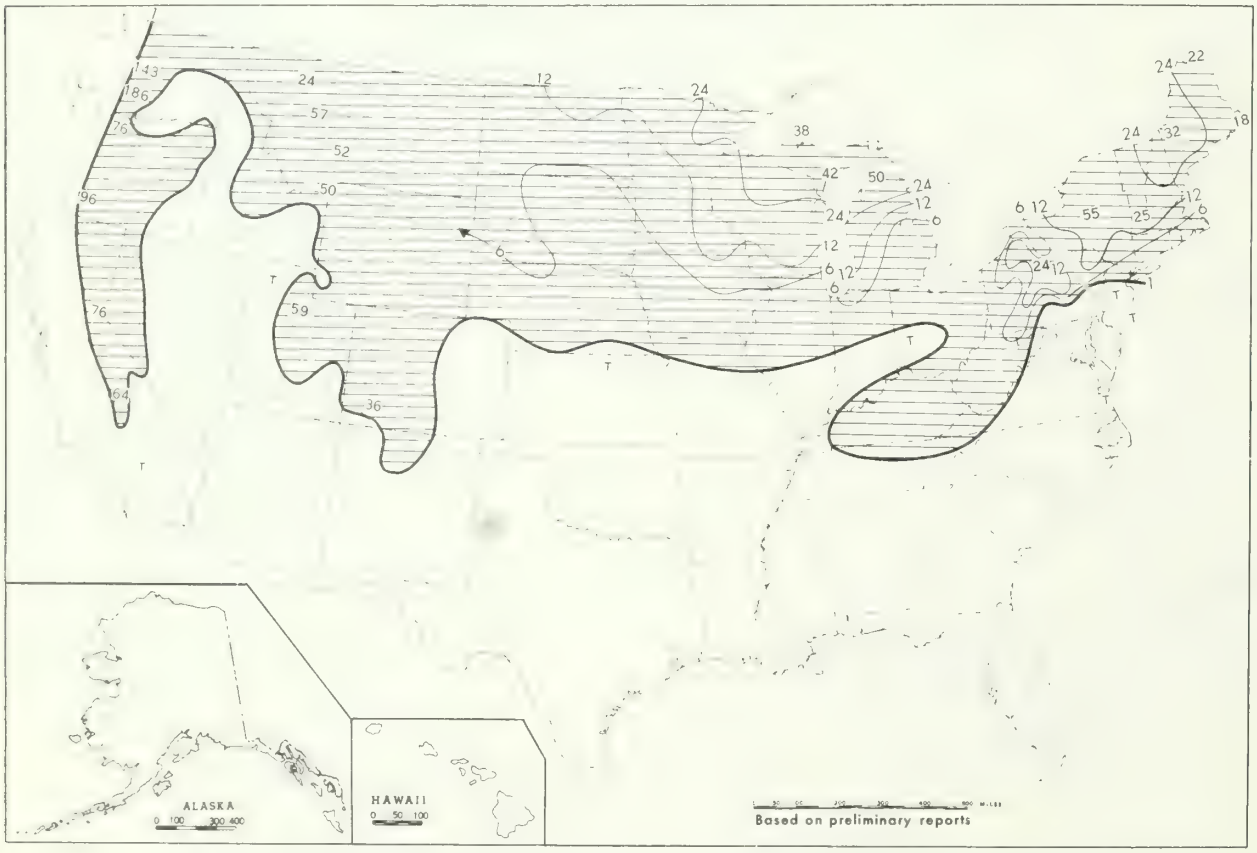
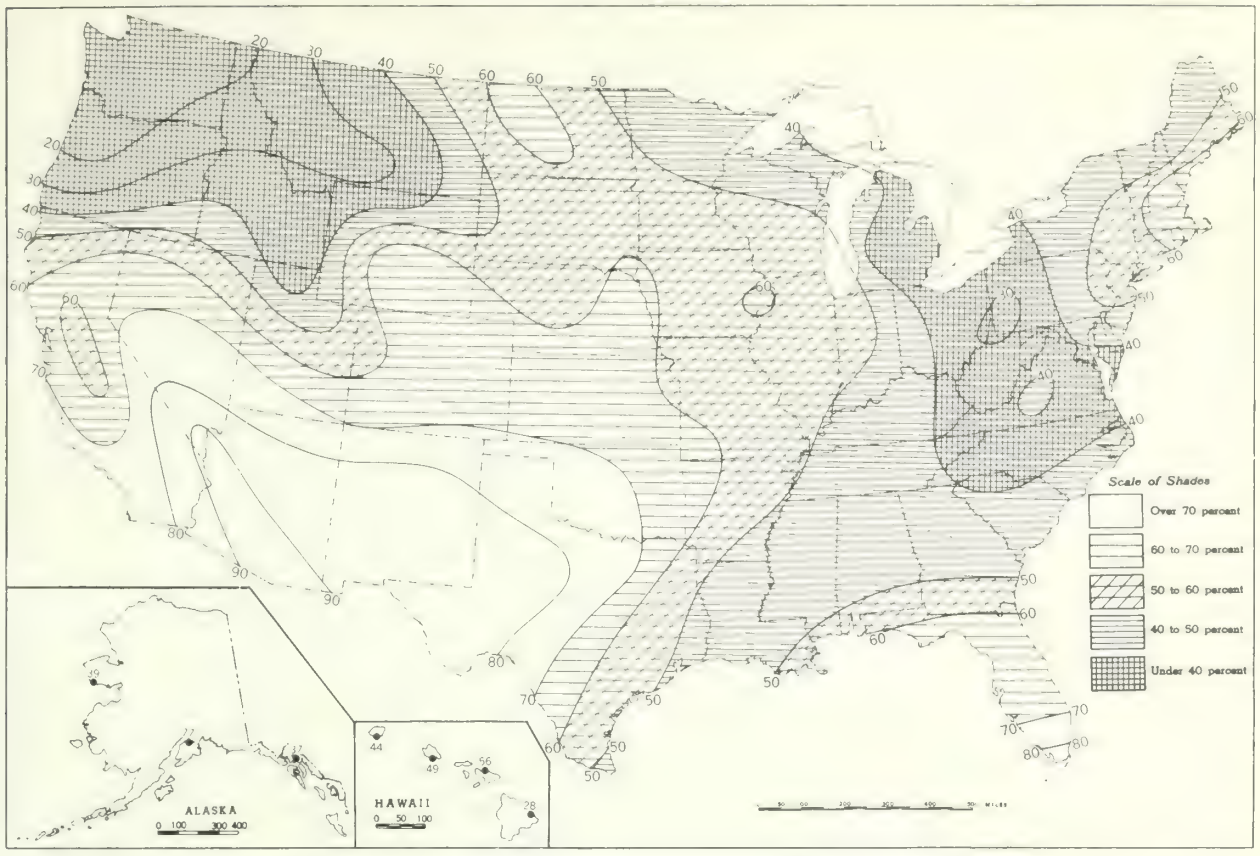
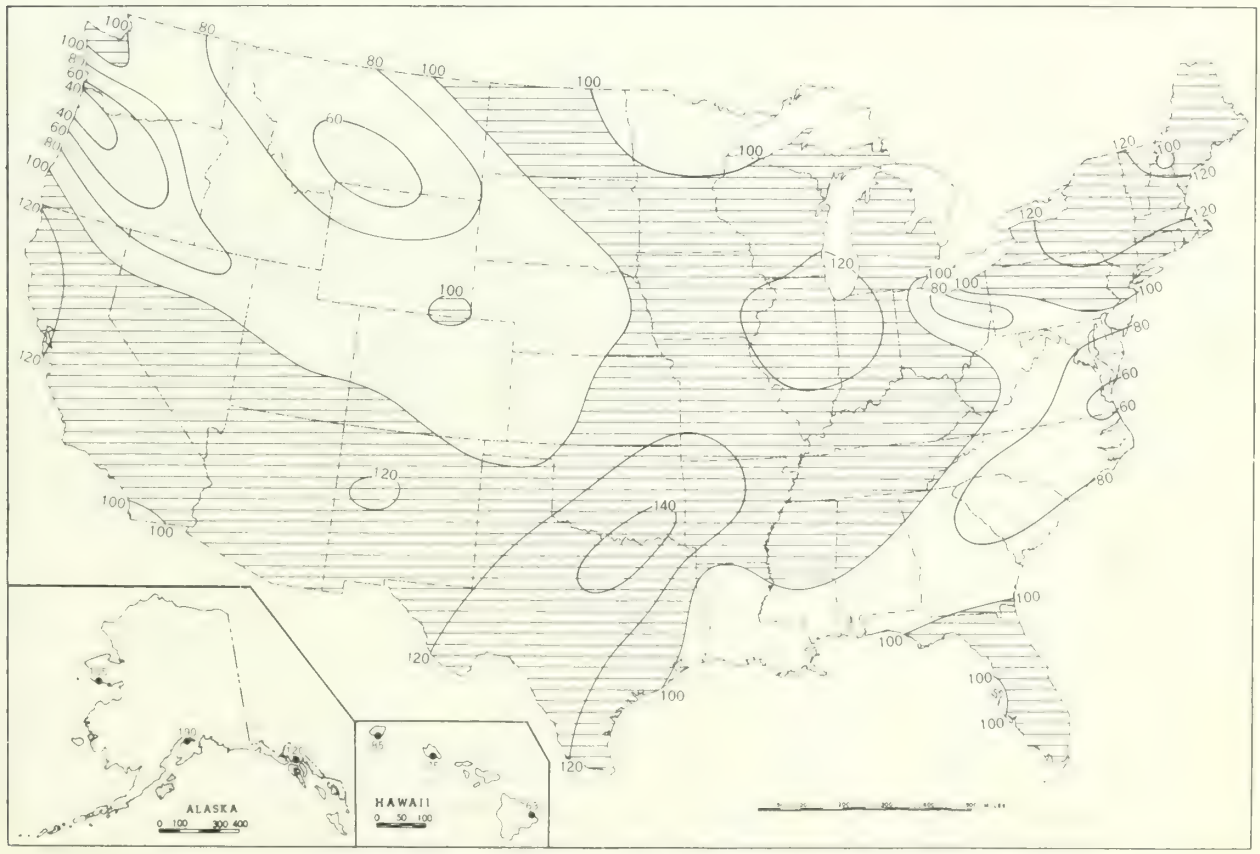


This is the total of unmelted snowfall recorded during the month at Weather Bureau and selected cooperative stations. This Chart and Chart V are published only for the months of November through April, although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year.

Chart V. A. Percentage of Mean Monthly Snowfall, January 1971

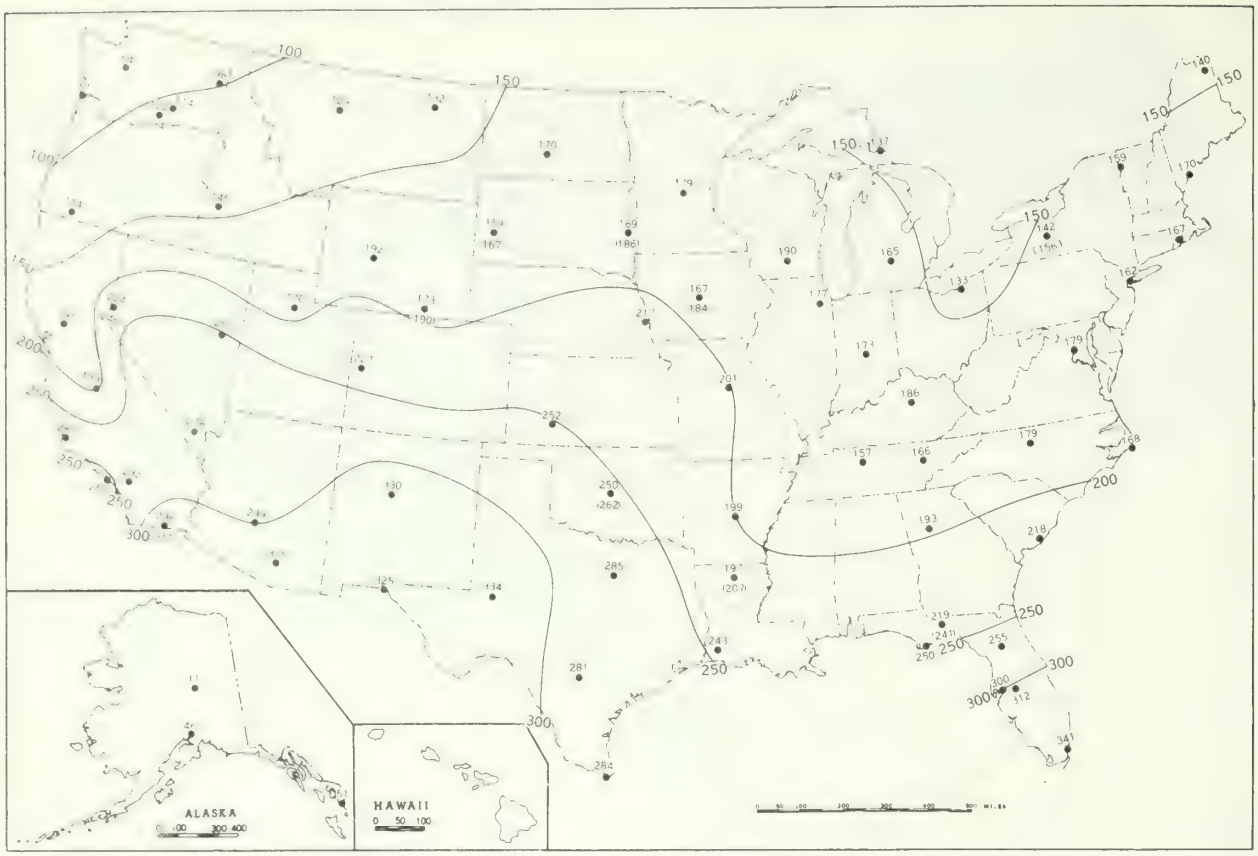


B. Depth of Snow on Ground (Inches), 7:00 a.m. E. S. T., February 1, 1971

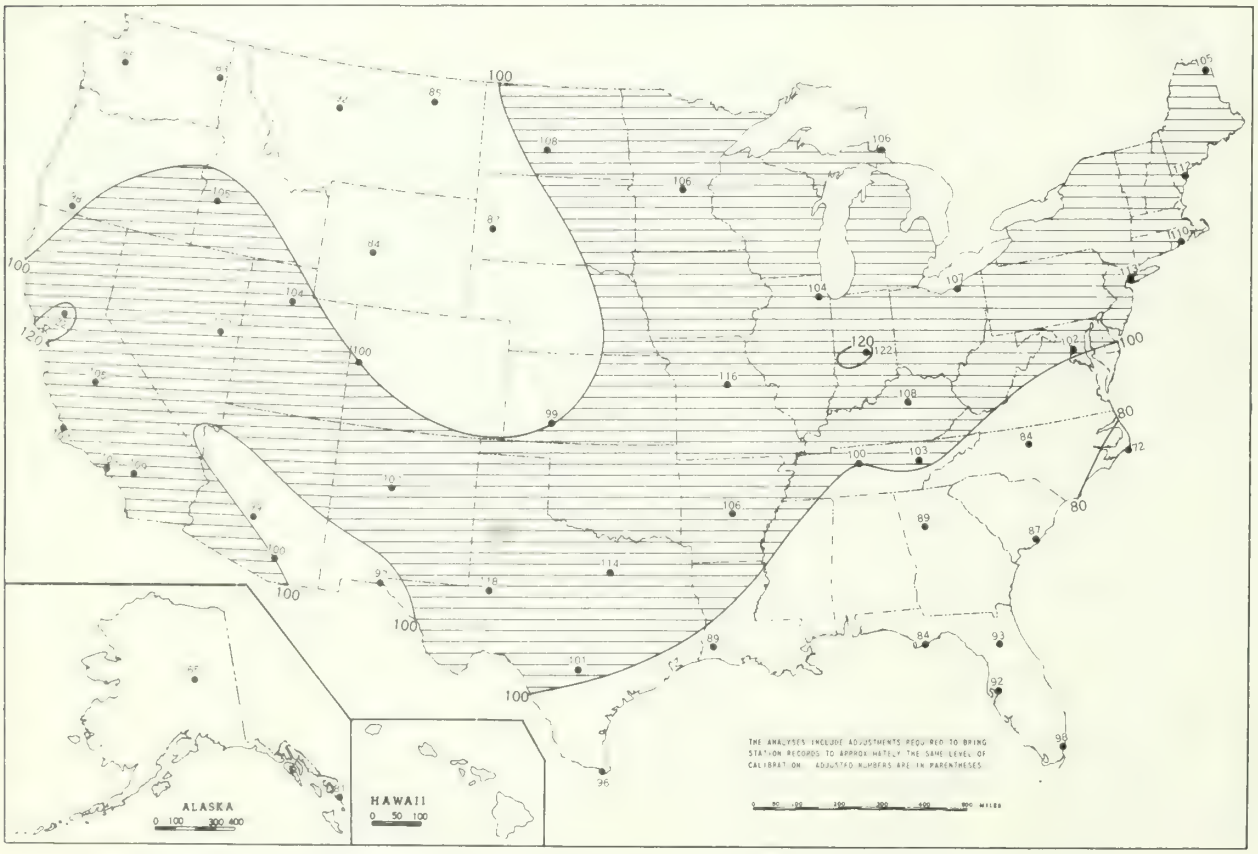


A. Amount of mean monthly snowfall is computed for Weather Bureau stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a.m. E.S.T., of the Monday nearest the end of the month.
It is based on reports from Weather Bureau and selected cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, January 1971

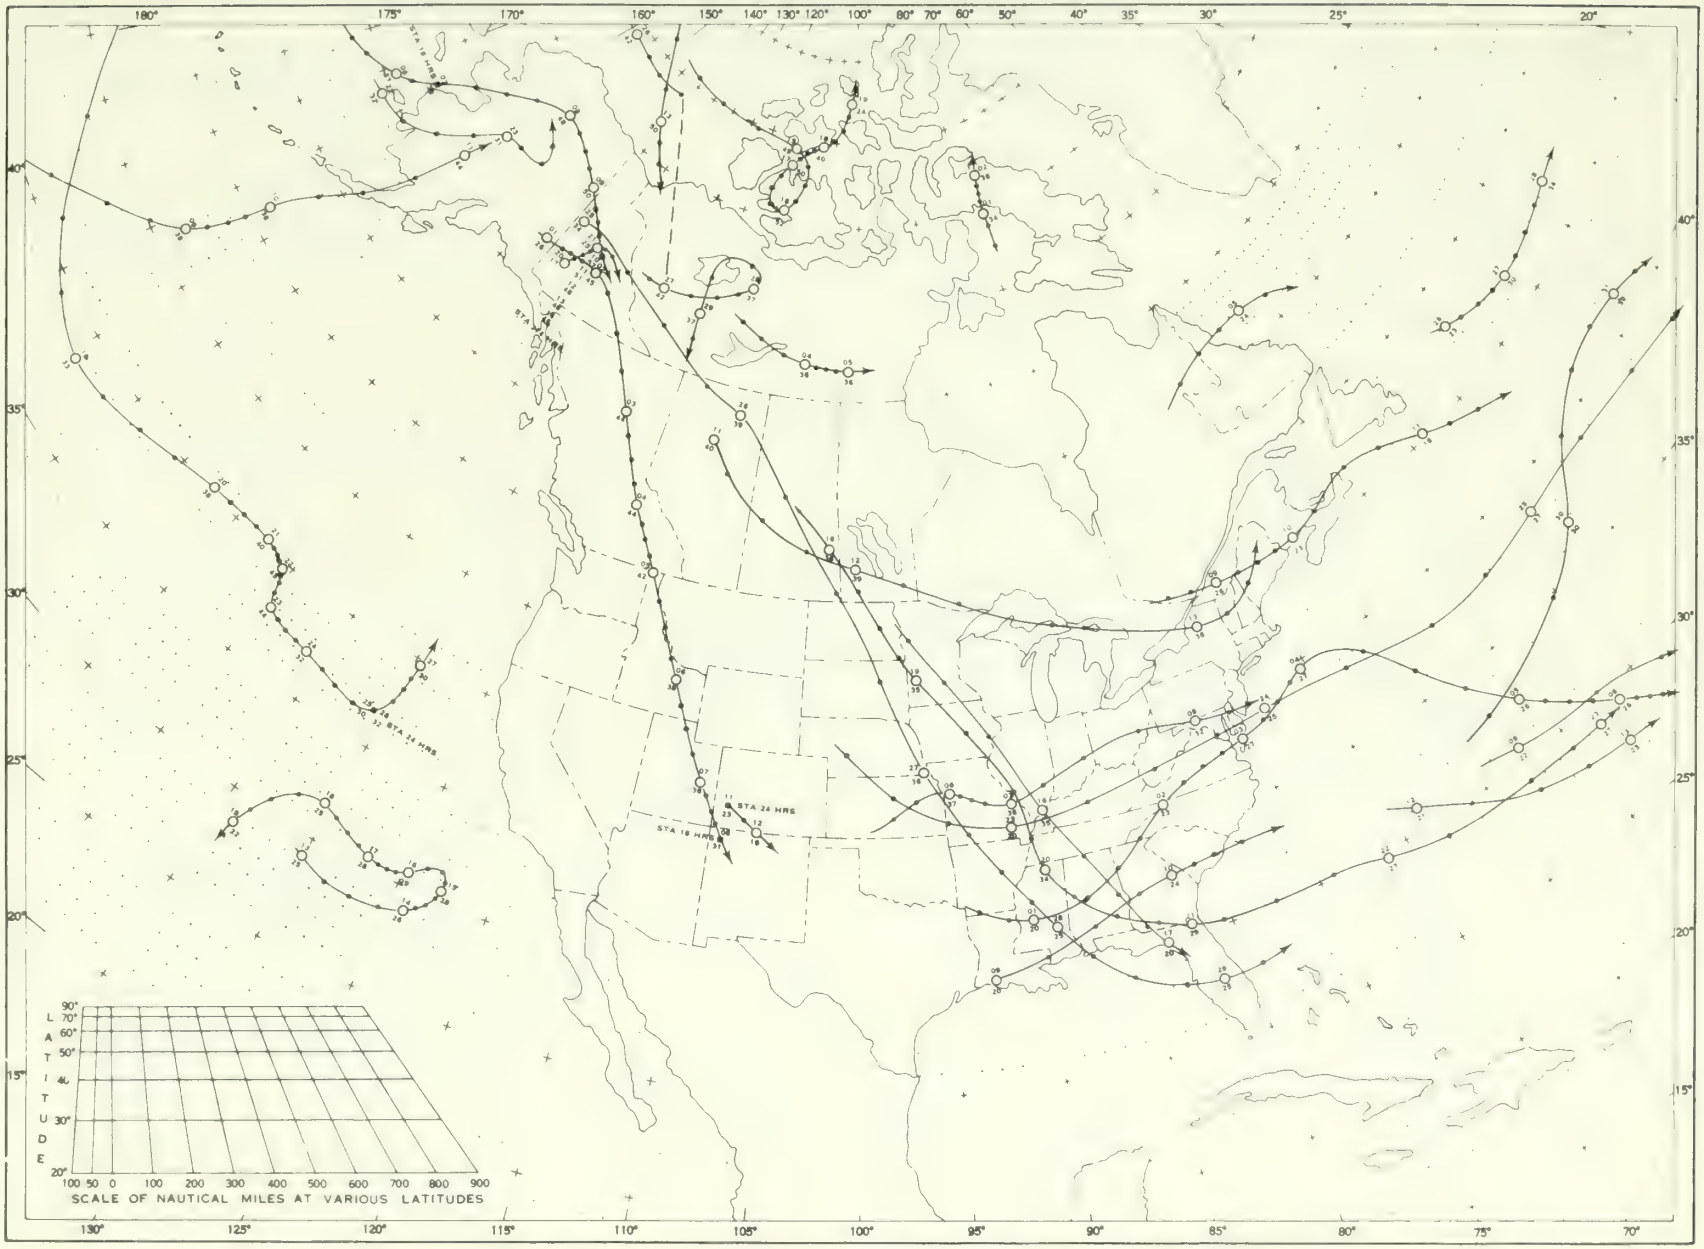


B. Percentage of Mean Monthly Sunshine, January 1971

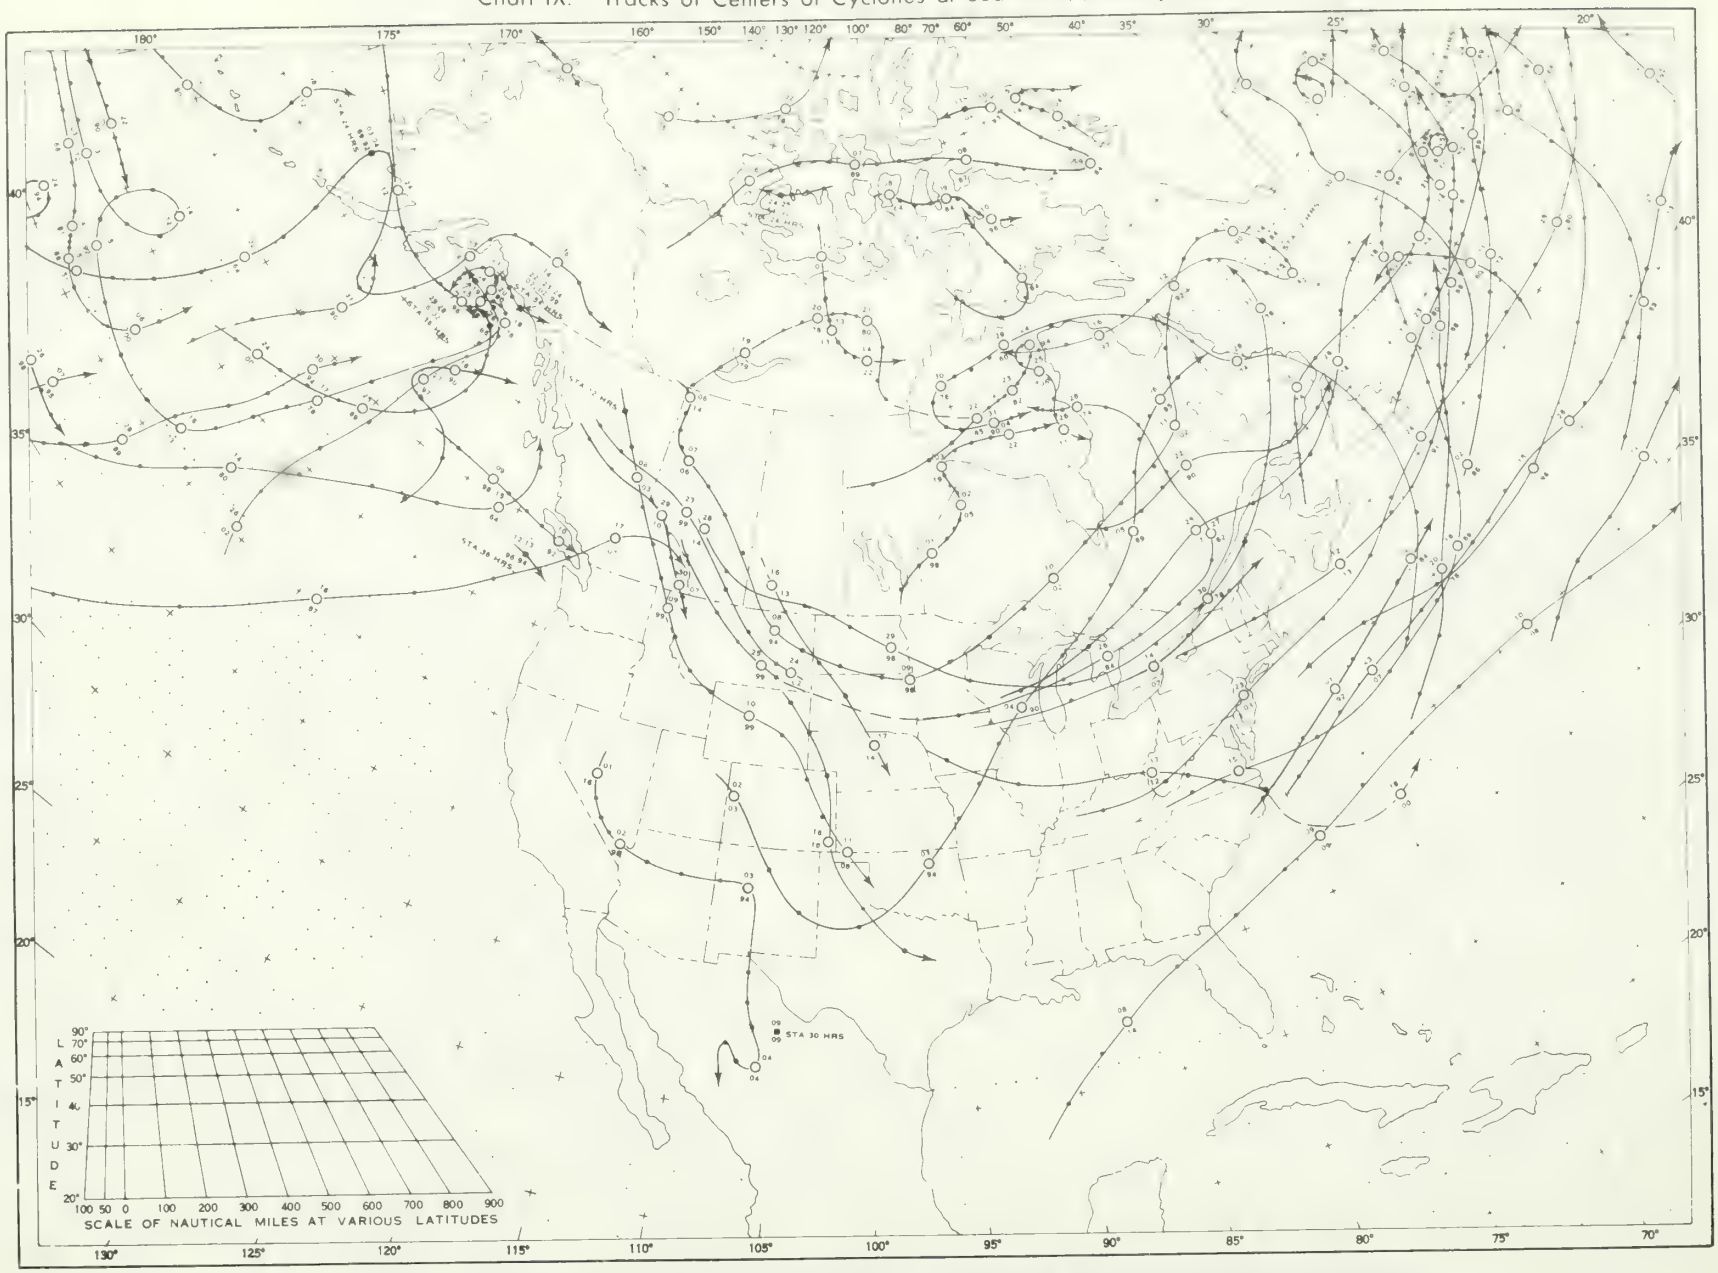


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, January 1971.

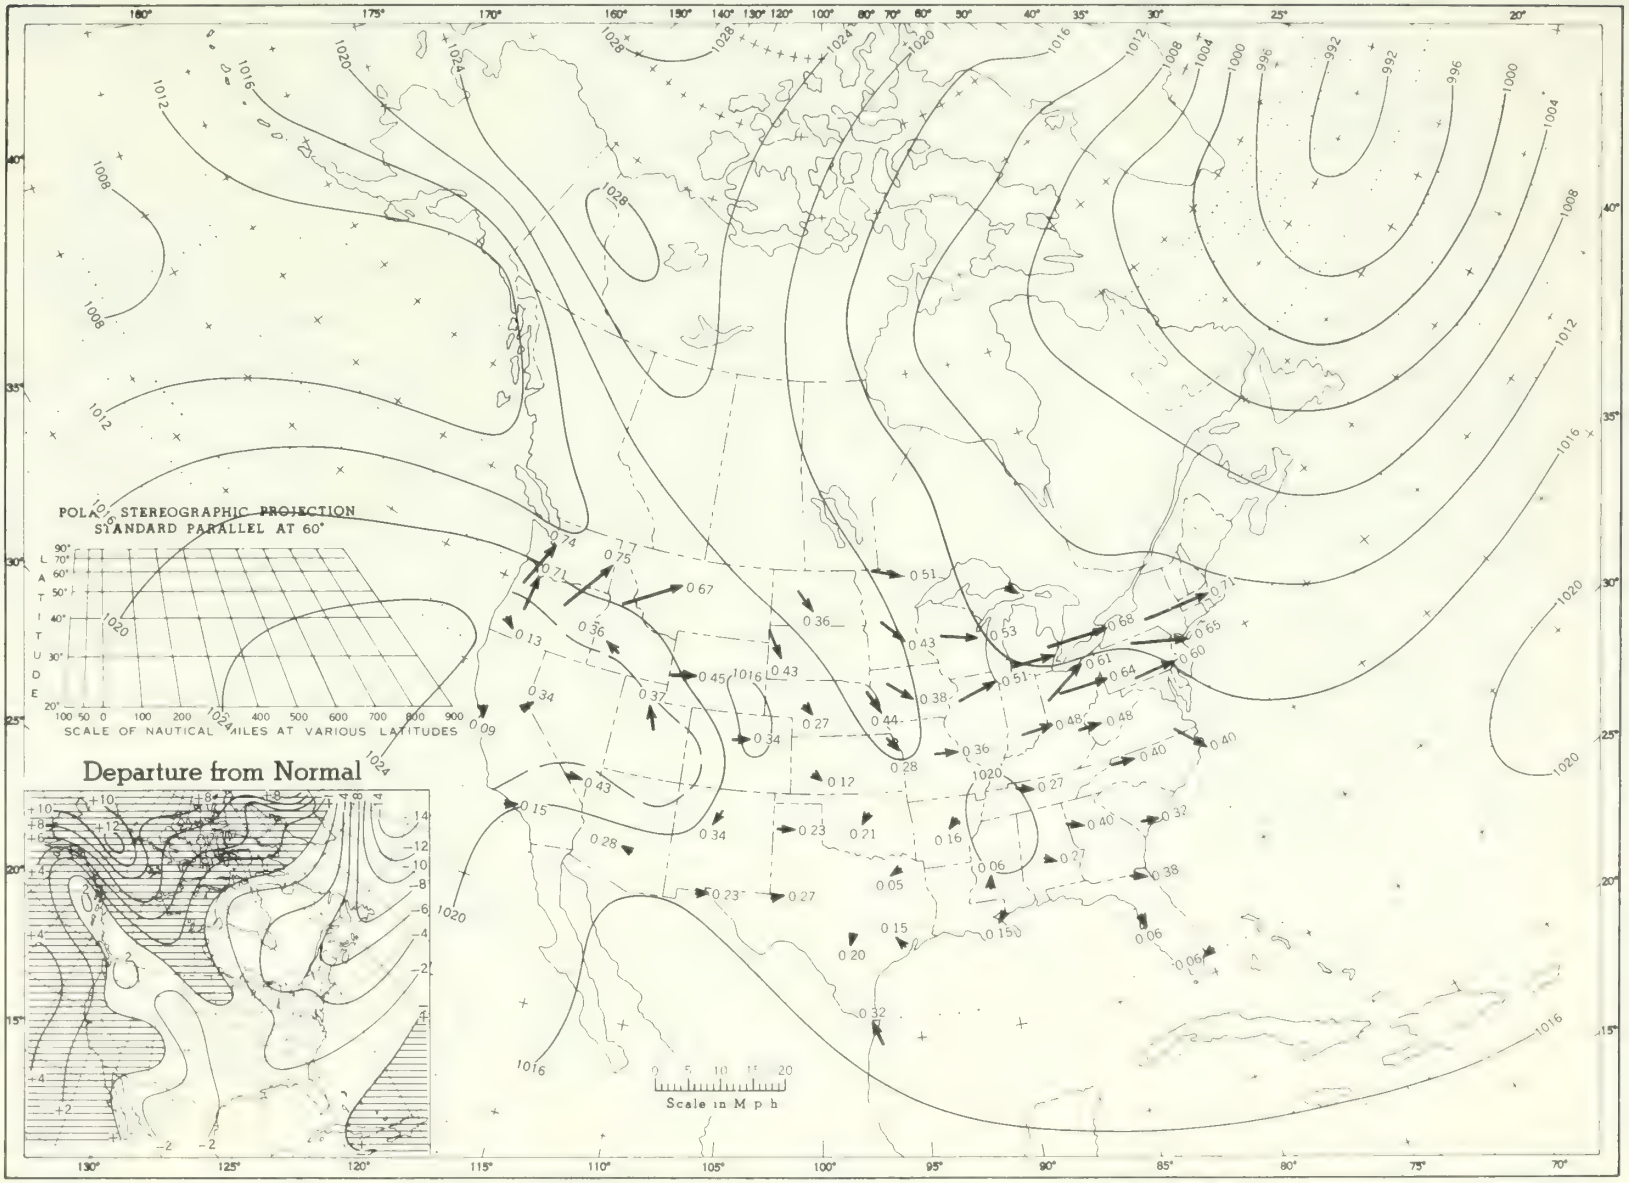


B. Percentage of Mean Daily Solar Radiation, January 1971



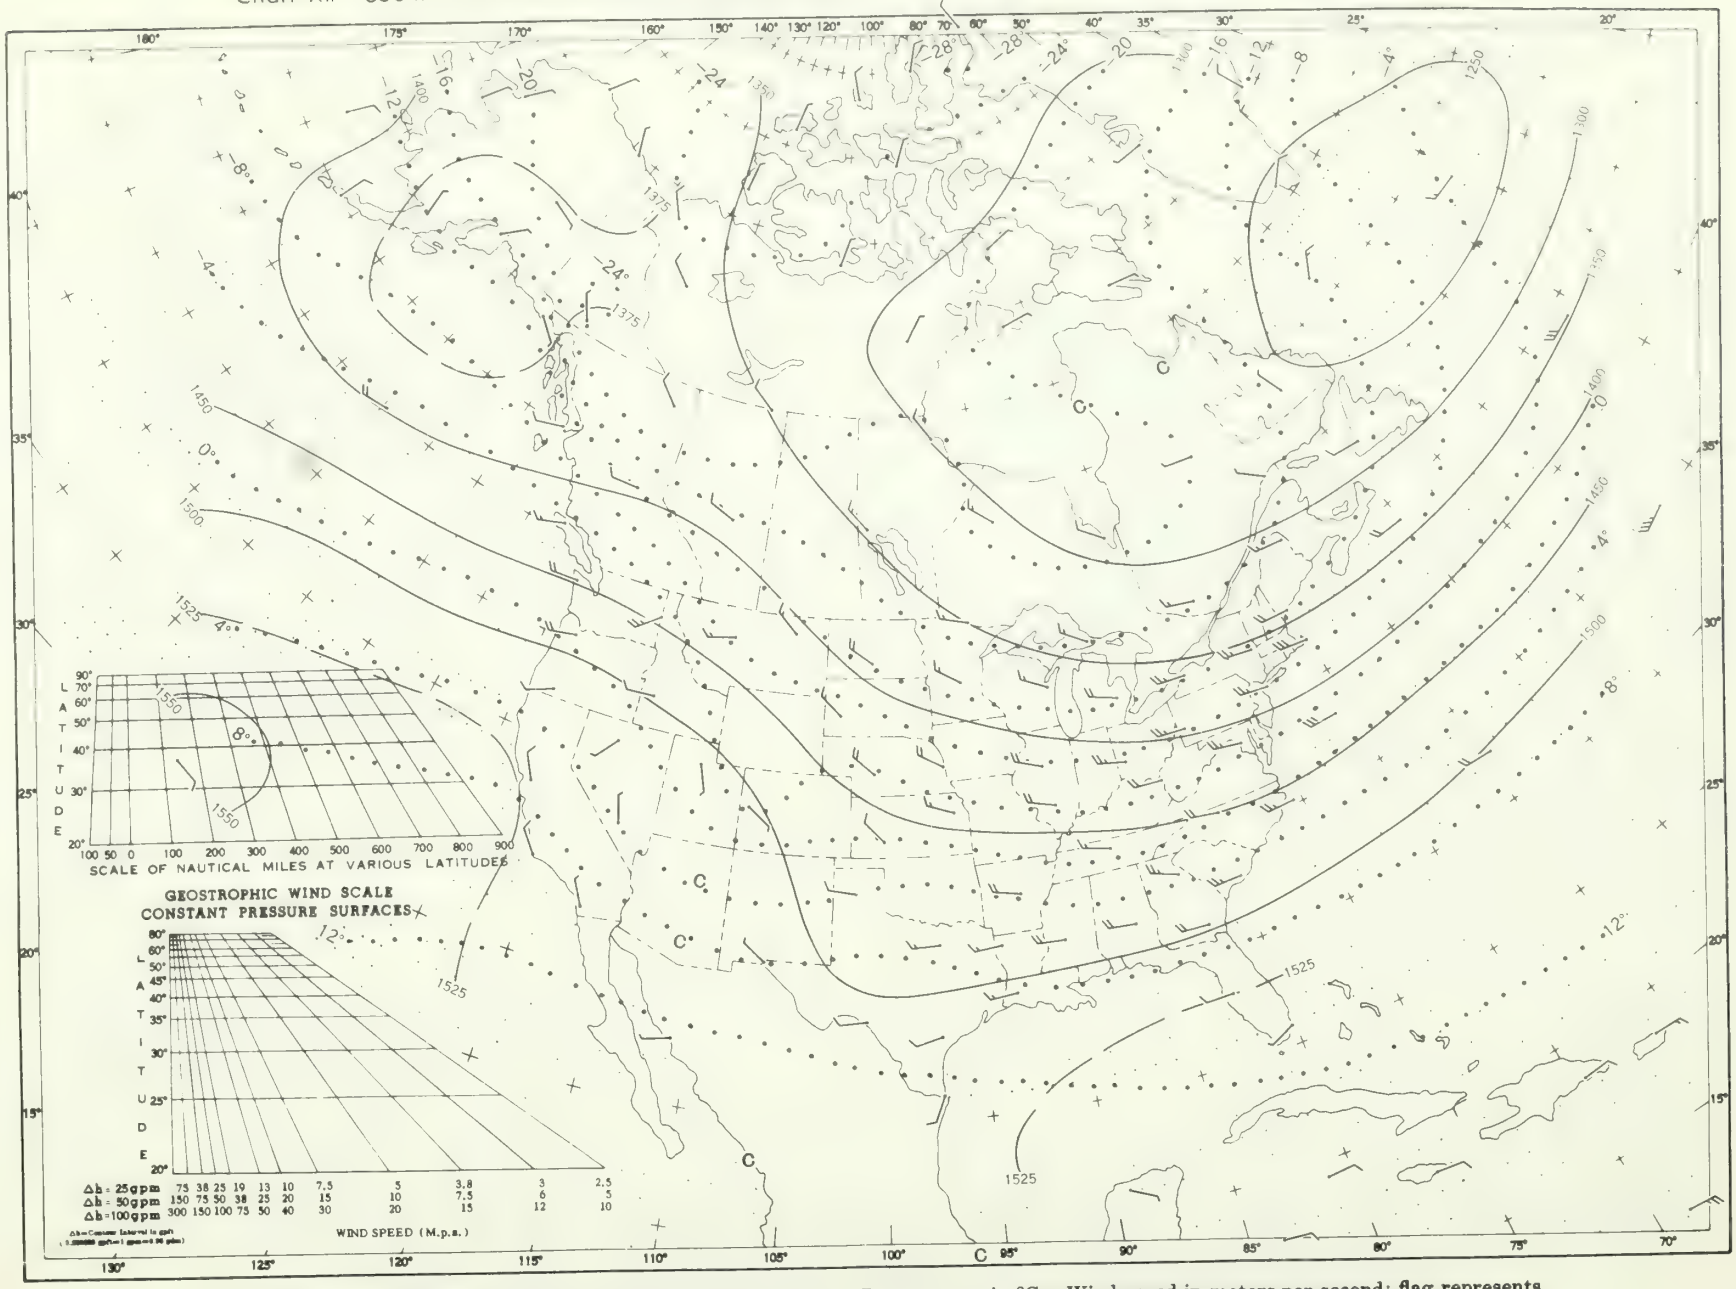
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, January 1971.



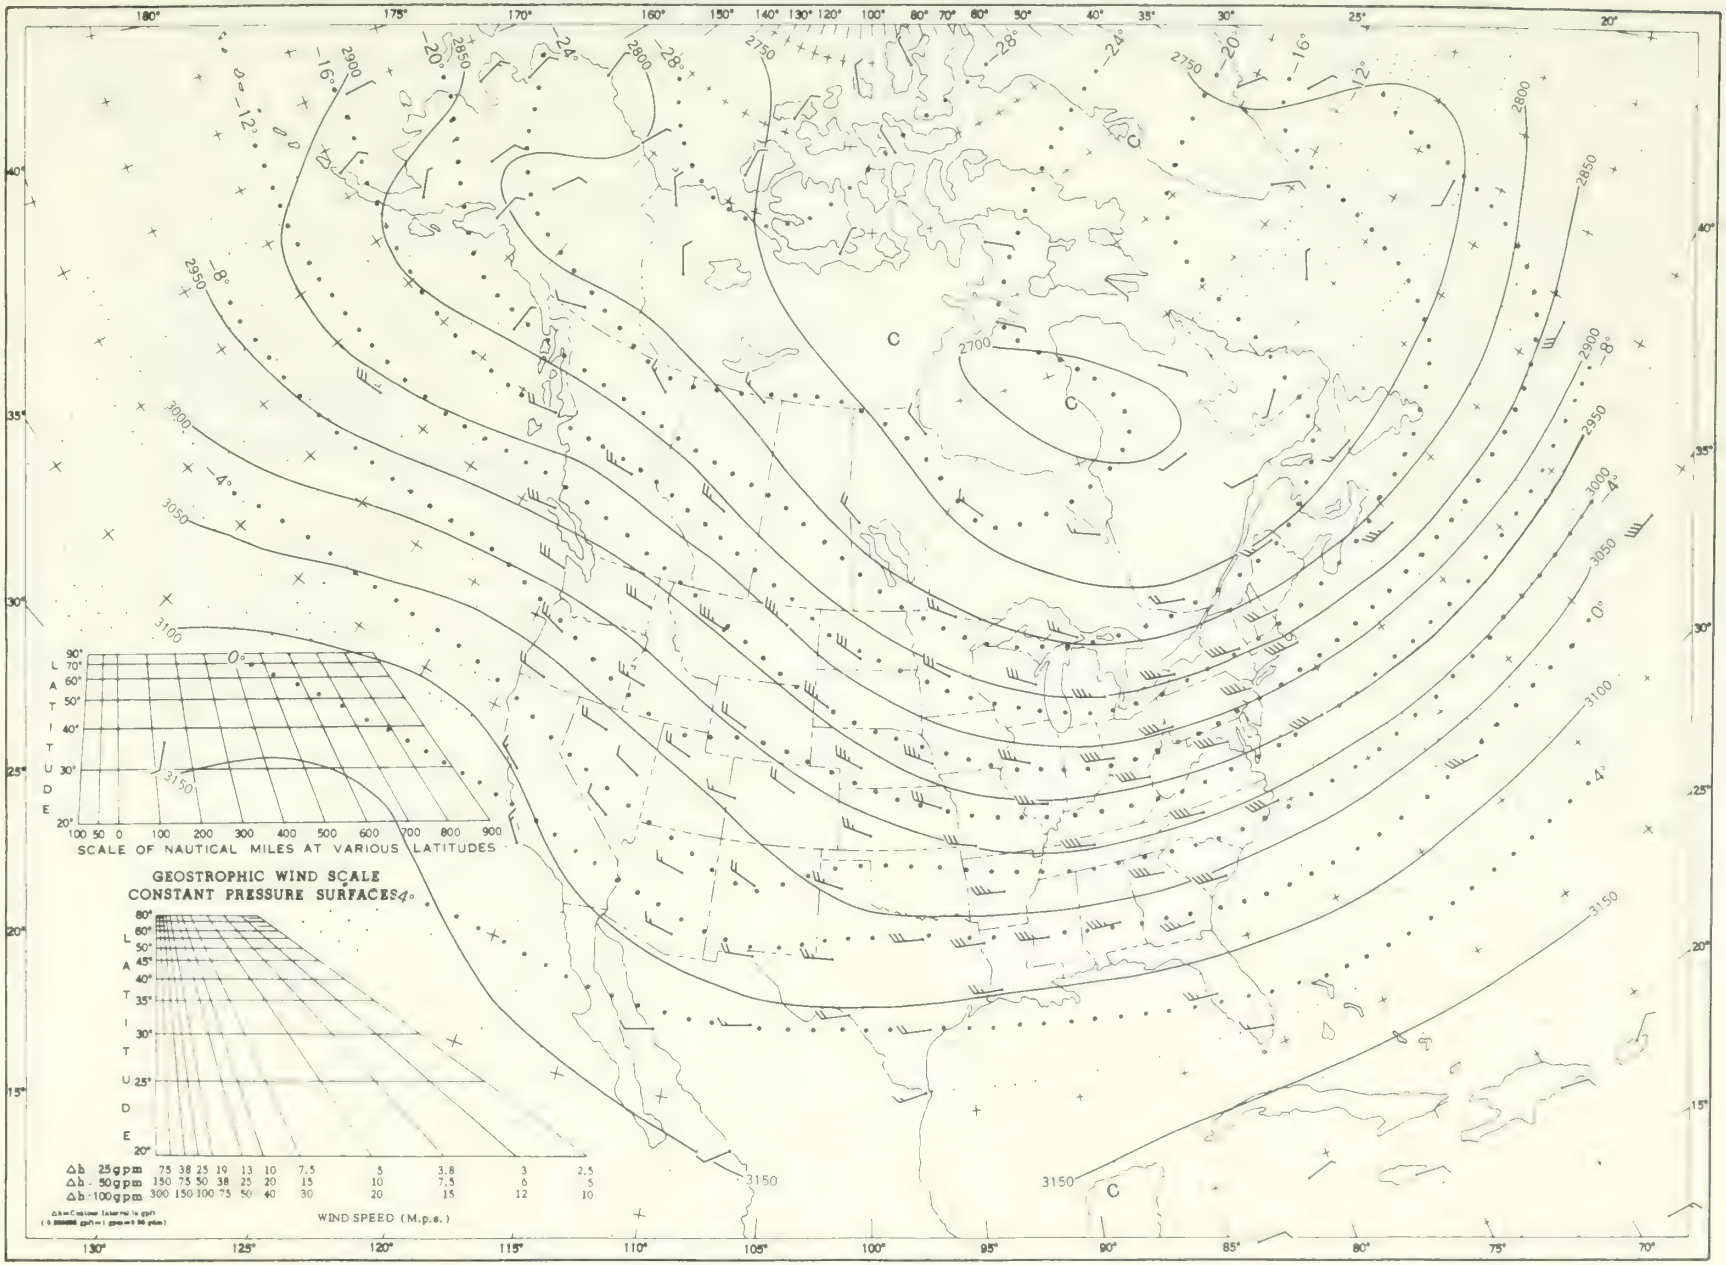
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, January 1971



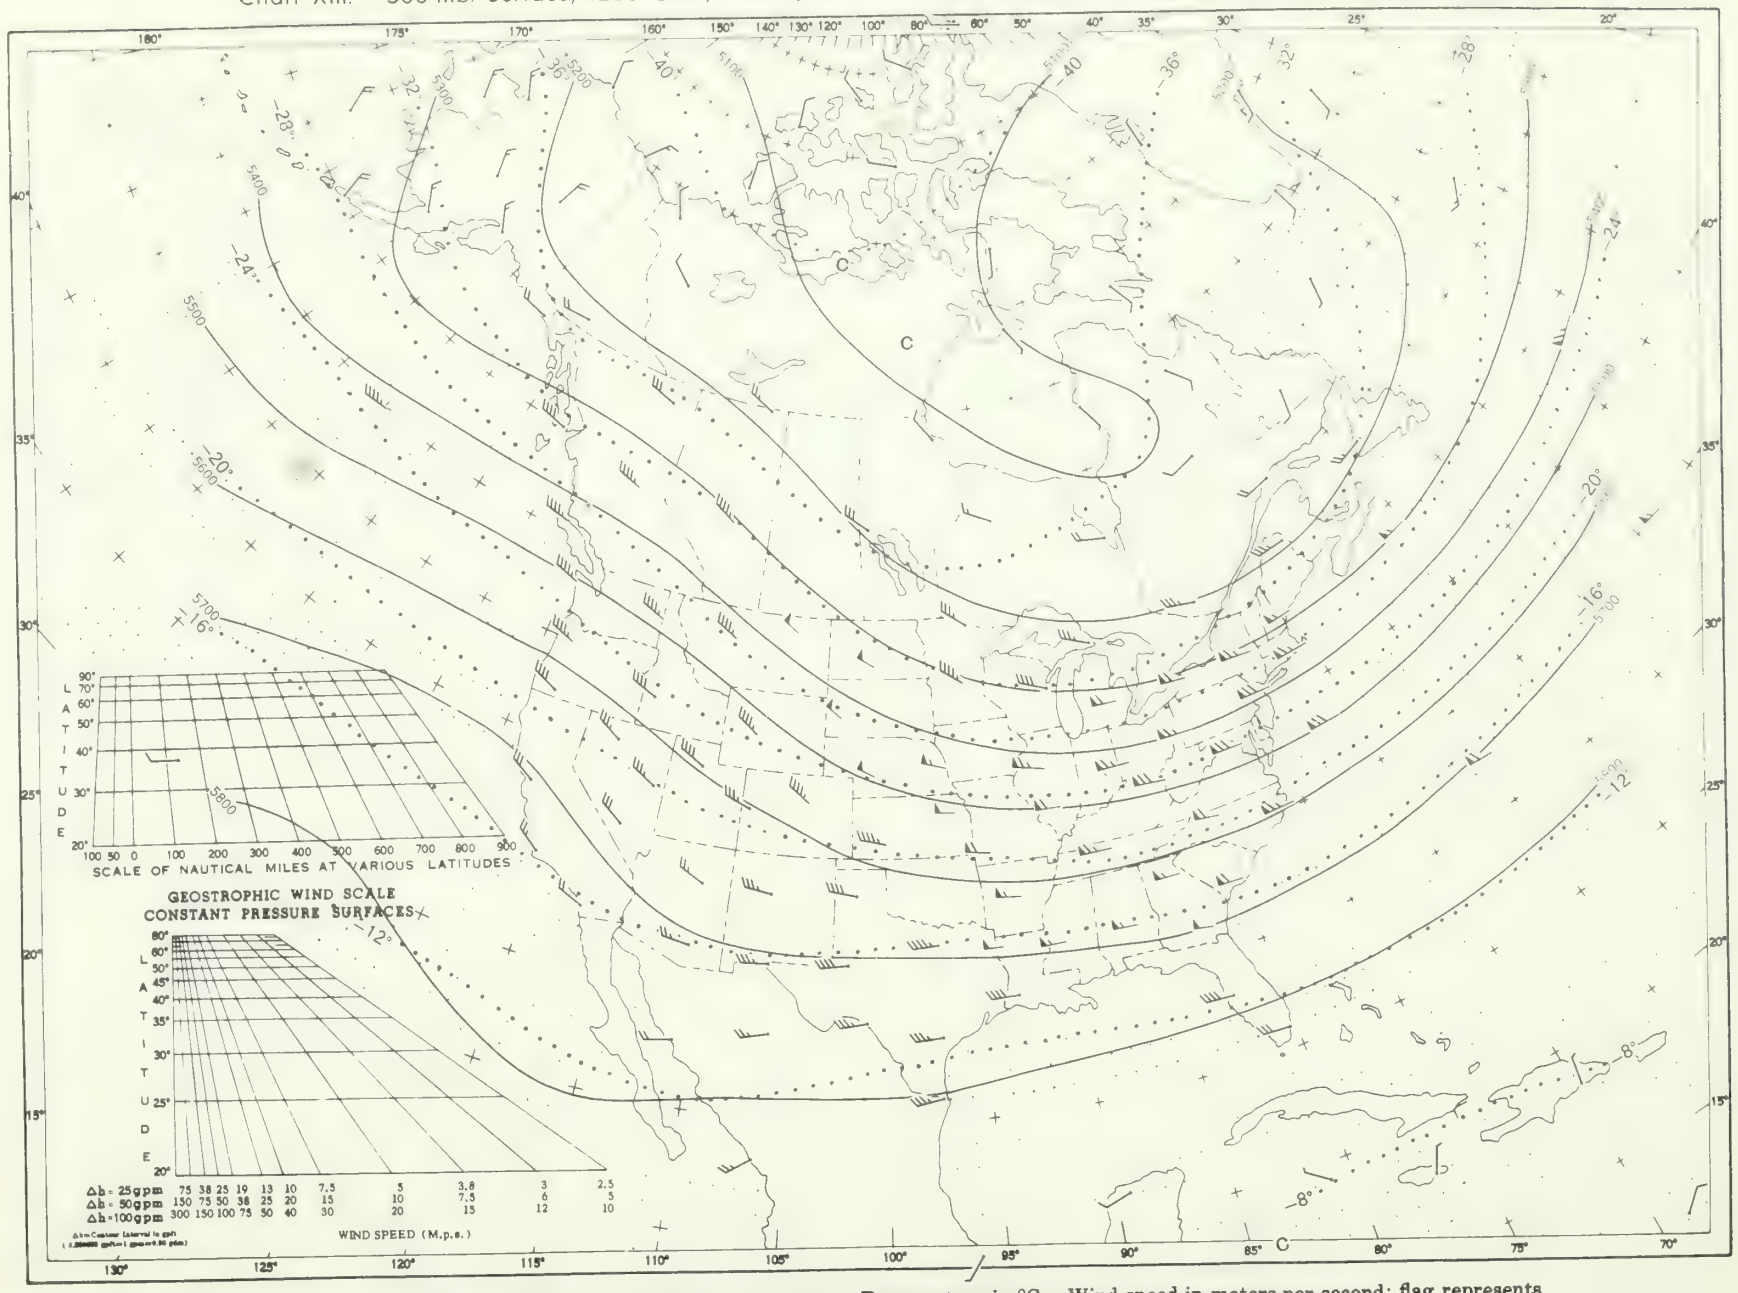
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, **January 1971** Inset. Departure of Average Pressure (mb) from Normal, **January 1971**



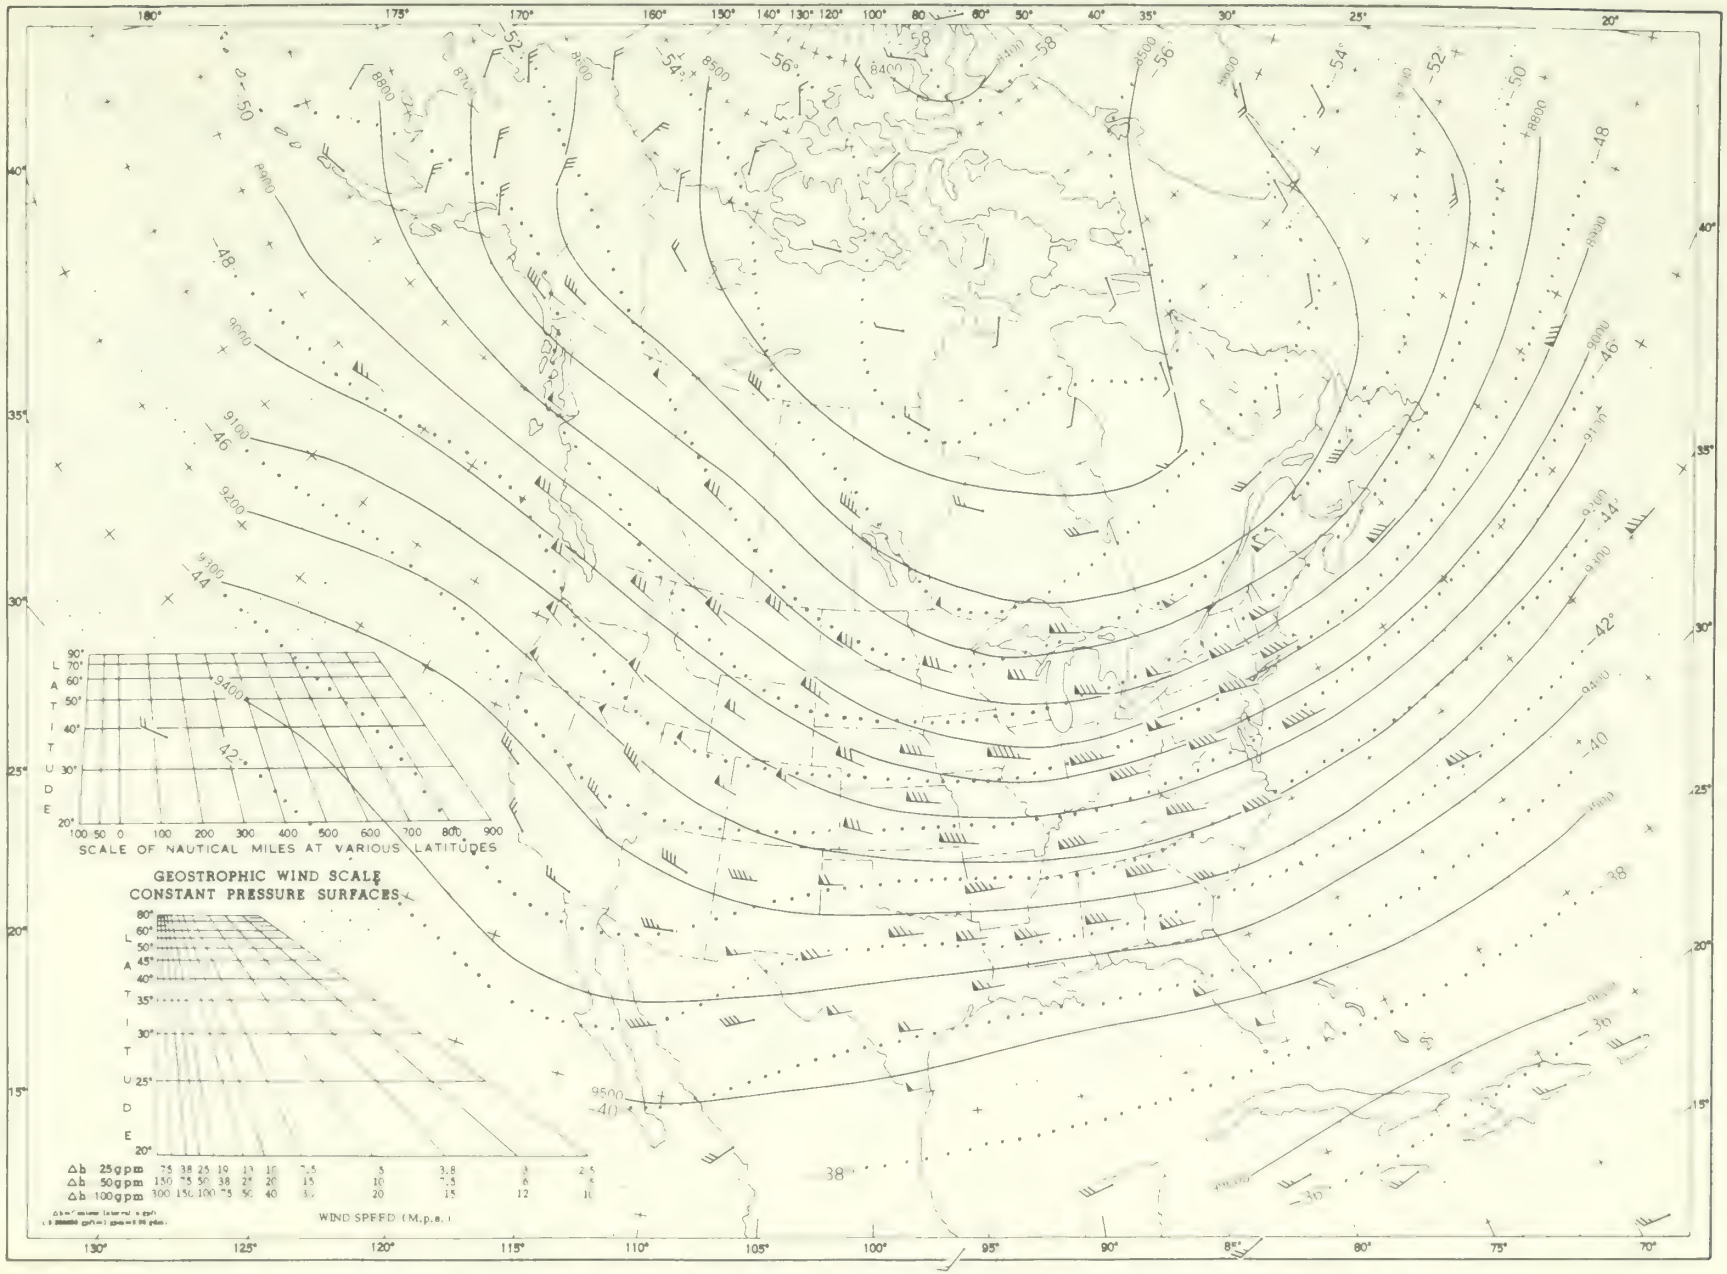
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb. Surface, 1200 GMT, **January 1971** Average Height and Temperature, and Resultant Winds



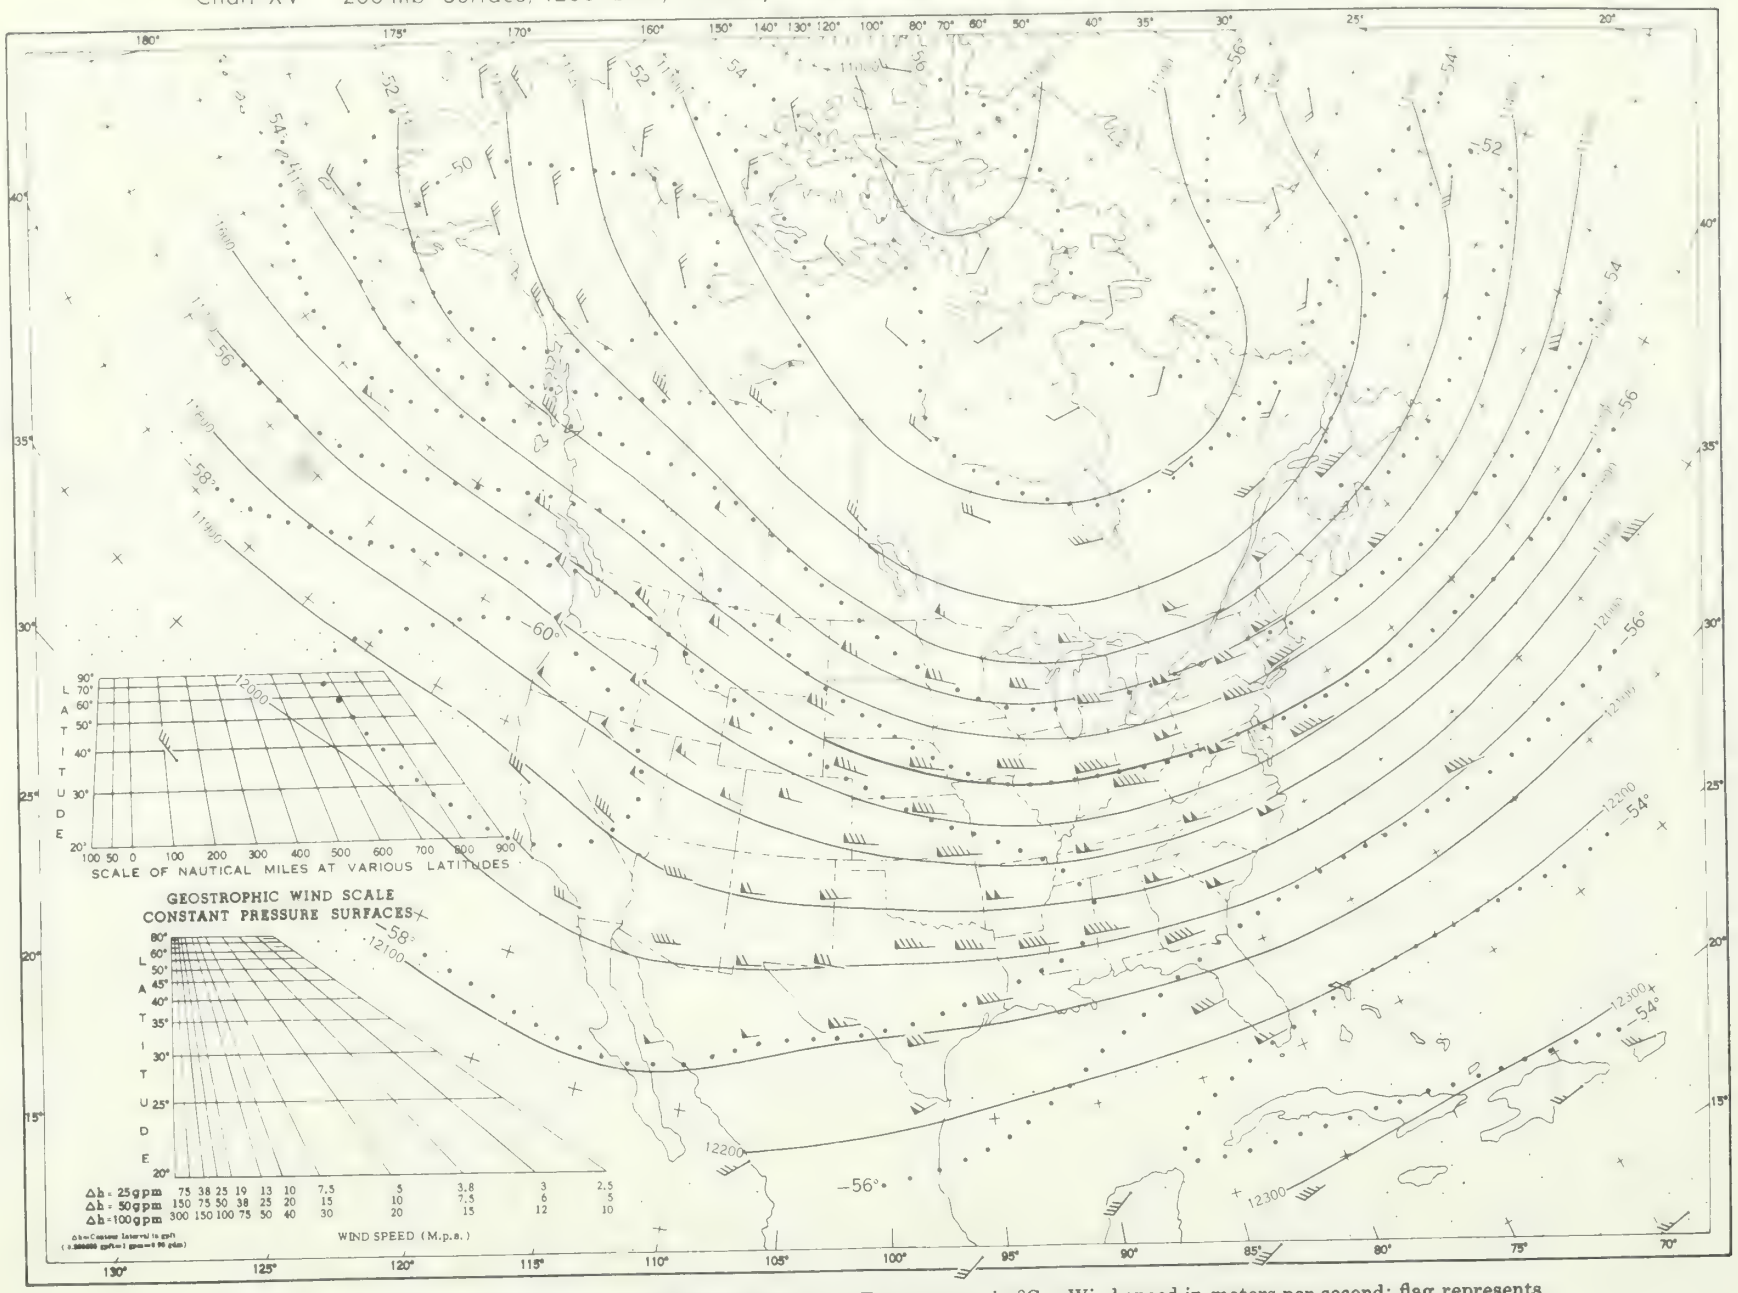
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, **January 1971**. Average Height and Temperature, and Resultant Winds



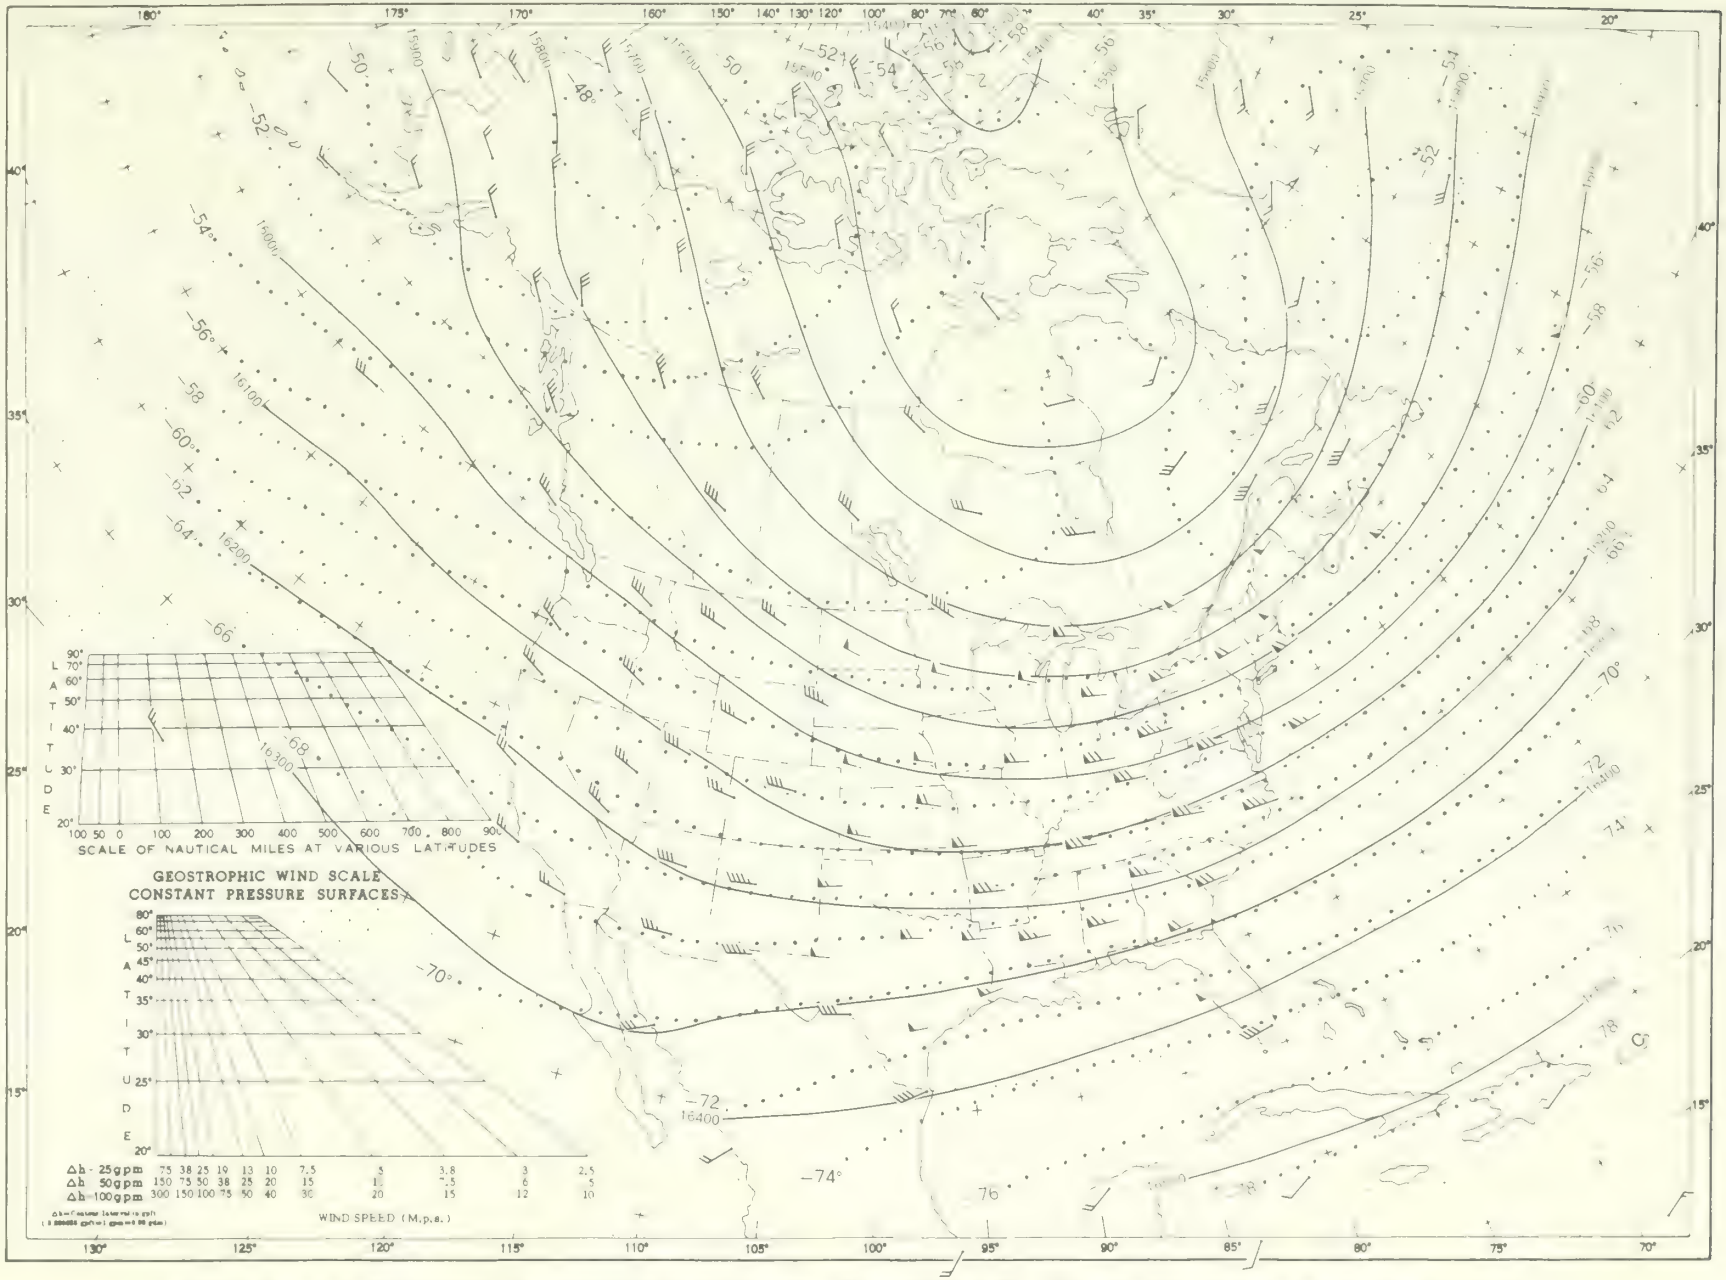
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 GMT, January 1971. Average Height and Temperature, and Resultant Winds



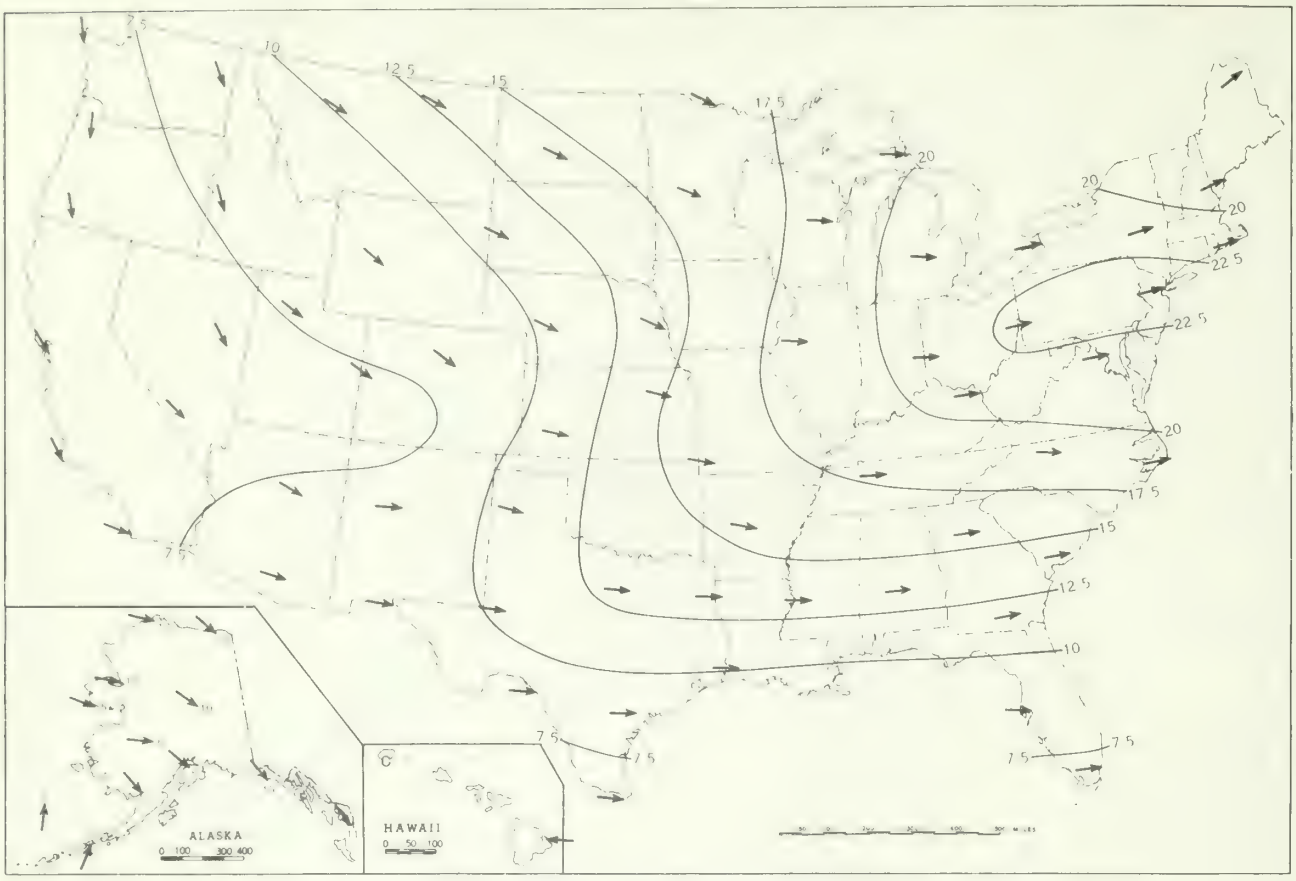
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV. 300-mb. Surface, 1200 GMT, January 1971 Average Height and Temperature, and Resultant Winds.



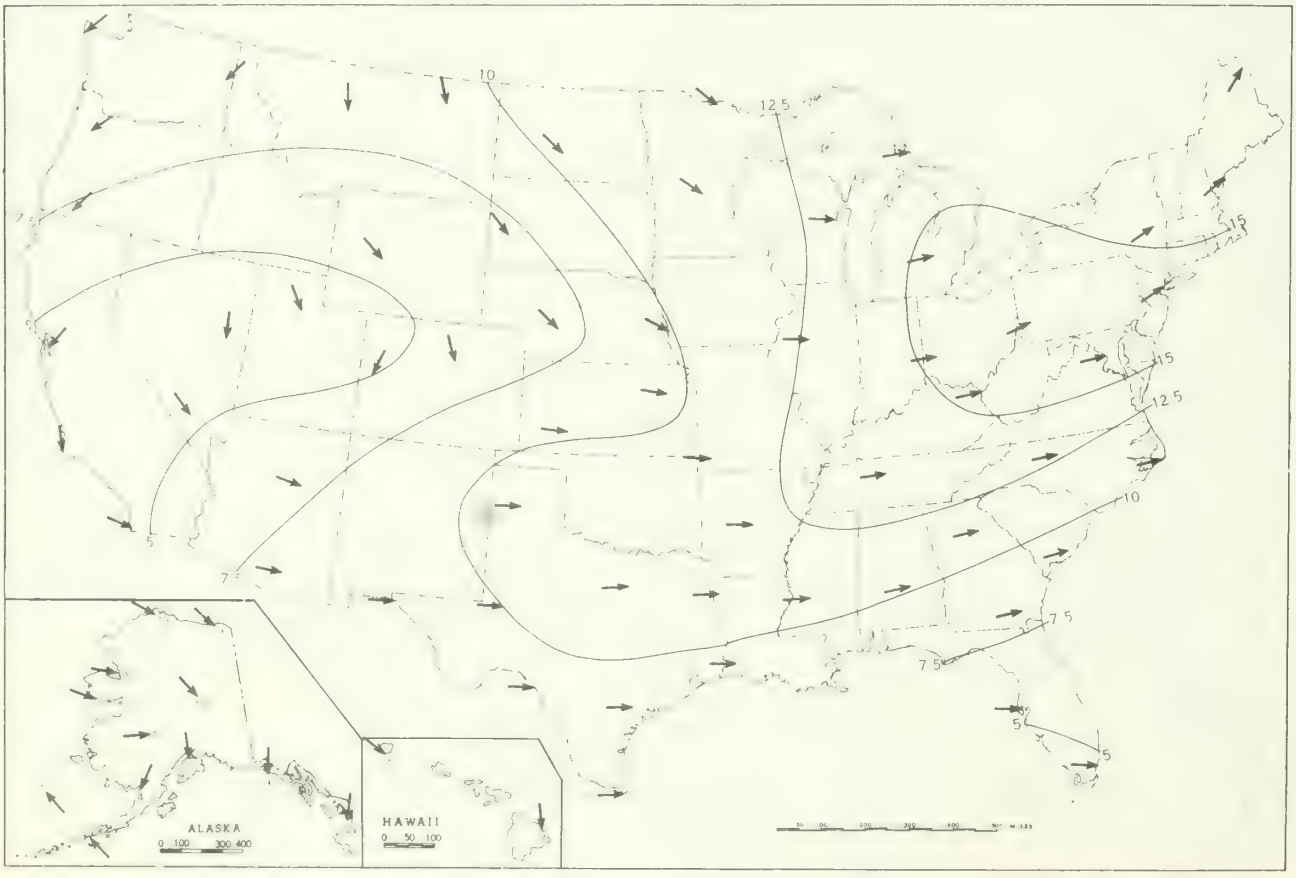
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV 200-mb Surface, 1200 GMT, January 1971 Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI 100-mb Surface, 1200 GMT, January 1971 Average Height and Temperature, and Resultant Winds.



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 GMT, January 1971. Resultant Winds.

B. 30-mb. Surface, 1200 GMT, January 1971. Resultant Winds.

Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 22 No. 2 FEBRUARY 1971

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Heavy snow fell over the northern and central portions of the Nation.
2. Heavy rains caused flooding in many streams in Nebraska, Missouri, Illinois, Pennsylvania, and parts of the Deep South.
3. Little rain fell in the southwestern quarter of the Nation. High winds and dust storms occurred in some southwestern areas.

TEMPERATURE. -- Temperatures averaged warmer than normal over the western half of the Nation during the first half of February and cooler than normal over the East. The situation was reversed in the last week. Warm weather prevailed over almost the entire Country in the 3d week. Monthly mean temperatures were 3° to 7° above normal in the northern Rocky Mountains and 3° to 7° cooler than normal in eastern Kansas, western Missouri, and from the Lower Ohio River to the southern Appalachians.

Subzero temperatures occurred on several mornings in the northern half of the Nation in the first half of February. Eagle River, Wis., registered 40° below zero on the 2d. London, Ky., recorded 10° below zero on the same date. Subfreezing weather occurred in the Deep South. About the middle of the 1st week of February, warm, moist, Gulf air pushed northward over mid-America and afternoon temperatures in the southern portions of Kansas and Missouri climbed into the 60's. Bitter cold continued over the northern Great Plains and eastward to New England where afternoon temperatures remained below freezing the entire week. February 7 was especially cold. Minimums dropped to zero or lower as far south as northern Kansas and afternoon temperatures failed to go as high as zero at some localities in the northern portions of Nebraska and Iowa. On February 8, the temperature at Waterloo, Iowa, plunged to 26° below zero. At the other extreme, Thermal, Calif., registered 94° on the 11th.

Pacific air brought a warming trend to the western and central portions of the Nation in the 2d week of February. Tulsa, Okla., recorded 16° as a maximum temperature on the 8th but 2 days later, the mercury had climbed to 60°. Great Falls, Mont., with 52° was as warm as Tampa, Fla., and Bismarck, N. Dak., with 35° on the 10th, was 10° warmer than Lexington, Ky.

Pleasant weather prevailed over most of the Nation in the 3d week of the month. Pacific air warmed the West while warm, moist Gulf air moved northward over the central and eastern portions of the Country. Few localities experienced subzero weather. Pellston, in northern Lower Michigan, plunged to 18° below zero on the morning of the 16th. Subzero weather occurred in northern New York, northern New England and at West Yellowstone, Mont., on the 17th. Afternoon temperatures were generally above the seasonal normals. Valentine, Nebr., registered 59° on the 15th, and Cotulla, Texas, recorded 89° on the 18th. The 3d week of February ended a cold spell which had prevailed over parts of the East for more than 2 months.

Cold air swept down across the Great Plains early in the last week of February. Temperatures dropped below zero in the Rocky Mountains from western Wyoming to northern New Mexico, and in parts of the northern Great Plains. Subfreezing weather occurred as far south as southern Texas where San Antonio registered 29° on the 23d. Record warmth occurred in the East. Hatteras, N. C., recorded 76° on the 22d, the highest February temperature of record for that location. By February 25, springlike weather occurred over much of mid-America. Afternoon maximums ranged from the 40's in the Dakotas to the 80's in the Rio Grande Valley. Orlando, Fla., recorded 88° on the 25th, and Tampa, Fla., registered 88° on the 26th. This set a new February record for Tampa. Meanwhile, bitter cold hit the Northeast. The mercury at Greenville and Houlton, Maine, tumbled to 11° below zero on February 25. Another cold blast hit the Far West at the end of the month. Bryce Canyon, Utah, recorded 21° below zero on the morning of the 27th and on the last day of February the mercury at Phoenix, Ariz., had tumbled to 31°. Dozens of stations in the central Rocky Mountains recorded subzero weather on the last day of February. Among the coldest in Colorado were: Twin Lakes Reservoir, -27°; Steamboat Springs, -29°; Frazer, -35°; Taylor Park, -38°; and Crested Butte, -25°.

PRECIPITATION.--A large and powerful storm began shaping up in the central Rocky Mountains on February 3. In the next few days it produced widespread precipitation over much of the eastern half of the Nation. Snow fell from the northern and central Rocky Mountains across the Great Plains to the upper Mississippi River Valley, freezing rain and freezing drizzle from the central Great Plains to New Jersey, and scattered thundershowers from Oklahoma to the Ohio River Valley and southward to the Gulf of Mexico. In most areas, the snow or rain was accompanied by fog. A few tornadoes hit Mississippi and Alabama late on February 4. A tornado at Grenada, Miss., killed 7 persons. Few localities in the eastern half of the Nation escaped the damp and dismal weather produced by the massive storm. To add to the misery produced by the storm, the winds gusted to over 70 m.p.h. at a few localities in the Ohio River Valley. Another storm moved out of the southern Rocky Mountains near the end of the 1st week of February. It produced snow from Colorado and New Mexico to New England. Showers and thunderstorms fell from the snow belt southward to the Gulf of Mexico. Hail fell from some of the thunderclouds. On the 7th, hail as large as baseballs fell at De Land, Fla. Tornadoes struck Georgia and Florida and funnel clouds were seen in South Carolina.

Severe weather occurred over much of the eastern half of the Nation in the 2d week of February. Heavy snow fell in parts of New York and New England. Heavy showers and thunderstorms occurred south of the snowblet. Tornadoes touched down in Georgia and Florida. Flash floods occurred from extreme southeastern Pennsylvania and New Jersey to Georgia. Shortly before midmonth, a storm moved from the Deep South to the Lower St. Lawrence River Valley spreading precipitation from the Gulf of Mexico to Lakes Erie and Ontario and eastward to the Atlantic Ocean. Heavy snow fell in the Appalachians from eastern Tennessee to New England. Freezing rain or freezing drizzle

fell east and south of the snow belt. Strong winds drifted the snow badly and the freezing precipitation iced the highways. The strong winds, deep drifts, and icy roads made travel difficult, and in some places, impossible. Numerous streams in Pennsylvania rose to above flood stage but the cold weather prevented rapid thawing and extensive major flooding.

More inclement weather occurred over the eastern half of the Nation in the 3d week of February, more snow in the Northeast and rain showers along the Atlantic seaboard. A storm in the West dumped 9 inches of snow at Cedar City, Utah. A number of tornadoes hit Colorado, Kansas, Oklahoma, and Texas. Near the end of the 3d week, heavy snow fell in parts of the Texas Panhandle and nearby portions of Oklahoma. Strong winds and drifting snow halted traffic in some areas. Numerous tornadoes occurred in the South from Texas to Georgia. In Mississippi, scores of persons were killed, hundreds injured, and property damages were estimated in the millions of dollars.

A massive storm centered over Missouri and Arkansas moved to New England in the last week of February. It dumped heavy snow along most of its path. The snowpack over parts of northern New England increased to 3 or 4 feet, 5 feet at Greenville, Maine. Deep snow drifts and blizzards halted traffic. Ahead of the storm, mixtures of snow and freezing rain iced the highways and made highway travel risky.

February 24 was a fairly decent day over most of the Nation but the touch of spring was short-lived. A new front brought snow to the Pacific Northwest and scattered snow fell in the northern Rocky Mountains accompanied, in some localities, by gales. The snow spread eastward and southward. Winds at Winslow, Ariz., gusted to 74 m.p.h. picking up sand and dust and reducing the visibility to about 200 yards. Severe weather occurred throughout the South from eastern Texas to Georgia.

Many stations in the northern and central parts of the Nation received more snow in February 1971 than in any previous February. In some areas, the precipitation totals, including the moisture from melted snow, set new February records.

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATES

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day-data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

CLIMATOLOGICAL DATA

METRIC UNITS

FEBRUARY 1971

State and Station	Elevation (ground)	Pressure: Station	Pressure: Sea level	Temperature: Average maximum	Temperature: Average minimum	Temperature: Average	Temperature: Departure from normal	Temperature: Highest	Temperature: Date	Temperature: Lowest	Temperature: Date	Temperature: No of days: Max 32.2 °C or above	Temperature: No of days: Min 0 °C or lower	Temperature: Average dew point	Average relative humidity	Precipitation: Total	Precipitation: Departure from normal	Precipitation: Greatest in 24 hours	Precipitation: No of days: 25 mm or more	Precipitation: No of days: With thunderstorms	Precipitation: Snow, Ice pellets: Total	Precipitation: Snow, Ice pellets: Maximum depth on ground	Wind: Resultant speed	Wind: Resultant direction	Wind: Fastest mile (1.6 kilometers): Speed	Wind: Fastest mile (1.6 kilometers): Direction	Wind: Fastest mile (1.6 kilometers): Date	No. of days (sunrise to sunset): Clear, 0.3	No. of days (sunrise to sunset): Partly cloudy, 4.7	No. of days (sunrise to sunset): Cloudy, 8.10	Sky cover, tenths (sunrise to sunset)	Possible sunshine

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

* Includes crop damage
C Crop damage
* No occurrence of storms or unusual weather phenomena reported.
‡ Includes heavy sleet storm.
\# Freezing drizzle and freezing rain, commonly known as glaze.
ø For breakdown of "All Others", and for detailed listing of other storms, see the NOAA Environmental Data Service, monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5,000,000
7 $5,000,000 to $50,000,000
8 $50,000,000 to $500,000,000
9 $500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS
FEBRUARY 1971

Elmer R. Nelson, Office of Hydrology

The most significant flooding during February occurred in western Iowa, western Missouri and northeastern Nebraska. Record flooding occurred on the North Branch Elkhorn River at Pierce, Nebr. Many communities without gages or records indicated the highest water in memory. Unprecedented lowland flooding occurred along the Elkhorn and other portions of the North Branch. The damages were heavy and estimated at approximately $5 million. The highest stage in the last 20 years was reported on the Nishnabotna River at Hamburg, Iowa.

HUDSON BAY DRAINAGE

Red River of the North Basin.--Much of the snowpack on the Dakota side of the Red River of the North melted during February and soaked into the porous surface soils, despite an unusually deep penetration of ground frost. The heaviest remaining snow cover is in the Red Lake River Basin and adjacent areas. Snow samples taken through the Red Lake River headwater Region during February indicate the water equivalent to be around 3.5 inches.

In the Souris Basin, the only snow remaining at the end of February was limited to the Turtle Mountains and the adjacent plain of Lake Souris.

Frost depths up to 5 or 6 ft. were common in most of the prairies. In the Red Lake Region frost depths from 0 to 6 inches were reported under the forest floor and in peat bogs.

ST. LAWRENCE DRAINAGE

Lake Michigan.--Extensive snow melt and rain in south-central lower Michigan caused up to 1 1/2 foot overflows on the Red Cedar on the 20-21st. No damage resulted from this overflow.

The headwaters of the Grand River rose to, but did not exceed, flood stage on the 23d. In the lower portion, ice jams appeared in the reach from Lowell to Grand Rapids, Mich., during the latter part of February. These ice jams caused fluctuations in the river levels with the area of Comstock Park, which is in the flood plain, receiving the most water and ice. Most of the damage resulted from ice action. About 40 homes were evacuated due to the high water.

Lake Erie.--Heavy rain on the 19-20th on frozen ground caused flooding on the St. Marys and Maumee Rivers in Indiana and on the St. Joseph River in Ohio. Ice jams occurred on the St. Marys River at Decatur, Ind., on the 21st and 22d. Additional precipitation on the 22d and 23d kept the rivers at high levels. The highest crest occurred on the St. Joseph River at Montpelier, Ohio, where it exceeded flood stage by 4.2 ft. on the 21st.

The Sandusky River at Freemont, Ohio, rose to bankfull stage on the 19th and 23d. Although some ice jamming occurred, the river continued to flow through the broken fields of ice.

Lake Ontario.--Canaseraga Creek at Groveland, N. Y., exceeded flood stage on the 27-28th. Route 258, across the valley, was closed by the flood waters. No damage resulted to structures or crops.

Minor flooding occurred on Oatka Creek at Garbutt, N. Y., on Feb. 28-March 1. No damage was reported.

Black Creek at Churchville, N. Y., exceeded flood stage on Feb. 27 to Mar. 3. The crest on Mar. 1 was 2.8 ft. above flood stage. Flooding in the lower Black Creek Valley, although extensive, was largely over pasture land, or land not in use at this time of the year. Little or no damage resulted from the high water.

ATLANTIC SLOPE DRAINAGE

Moderate to heavy precipitation in southeastern Pennsylvania and New Jersey early on the 13th caused sharp rises and overflows on many streams. The area of flooding extended from Brandywine Creek northeastward along the central and lower Schuylkill into the lower Lehigh River Valley in central New Jersey. Evacuations were necessary in some sections along the Schuylkill. Damage occurred along the Schuylkill and its tributaries from below Reading to below Pottstown, Pa. One death resulted from the high water in Pennsylvania. Minor damage occurred along the Jorden and Little Lehigh Creeks in Pennsylvania and along the Raritan River and Millstone Creek in central New Jersey.

The worst ice jam in recent years formed on the Susquehanna River below Harrisburg, Pa., causing flooding for 12 hrs. on the 15-16th. Flood damage was confined primarily to basements that were flooded due to water backing into sewers. Although the ice jam persisted, river levels receded slowly until the afternoon of the 19th when a channel opened through the jam allowing the water level to drop more rapidly. As the surge of water and ice moved down stream, temporary flooding resulted in communities along the Susquehanna River as far as York Haven, Pa. Farther up stream, snow melt and ice jams caused the Susquehanna to overflow its banks at Conklin, N. Y., on the 23d-29th and at Bainbridge, N. Y., on the 28th. The Chemung River at Chemung, N. Y., rose 2.2 ft. above flood stage on the 28th. No damage was reported.

Heavy rainfall (1.25 to 2.5 inches) on the 12-13th in the upper James Basin produced slight flooding at Lick Run, Buchanan and Bremo Bluff, Va. The overflow lasted 24 to 36 hours on the 13-16th. Downstream, the Westham gage at Richmond, Va., was above flood stage for over 48 hours on the 14-16th. A second rise on the 22d-24th brought stages in central and lower reaches to near bankfull, but no flooding resulted.

A mixture of frozen and liquid precipitation on the 3d-5th caused minor flooding on the middle reach of the Neuse and along the lower Cape Fear River in eastern North Carolina. The total precipitation ranged between 1 and 2 inches. Additional heavy rain (1 to 2 inches) on the 7-8th along the already swollen Neuse River raised the water level to over its banks at most gaging points by the 9th. The middle portion of the Cape Fear River rose 3 ft. over its banks and the lower portion 9 to 11 ft. above flood stage. The lower Tar and the lower Roanoke Rivers rose slightly above bankfull stage by the 13th. Precipitation on the 13th, ranging from 0.5 to 1.5 inches, prolonged the flooding. One to 2 inches of rain over the middle reaches of the Neuse on the 22d produced light flooding in the lower portion.

The Lumber river at Lumberton, N. C., continued above flood stage the entire month. The Little Pee Dee River at Galivants Ferry, S. C., was out of its banks from the 10th to the 20th with a crest 0.5 ft. above flood stage on the 14-15th. Moderate flooding moved downstream on the Pee Dee River from Cheraw to well below Peedee, S. C., on the 9th-22d. Minor flooding occurred on the Saluda River at Chappells, S. C., on the 8-9th. No significant damage resulted from the overflows.

Moderate flooding occurred along Stevens Creek

at Modoc, S. C., in the Savannah drainage on the 7-9th. Slight to moderate damage resulted. The light flooding along the Ogeechee River in Georgia from the 12th to the 24th caused slight damage.

Two to 3 inches of rain through central Georgia on the 7-8th produced light flooding on the Ocmulgee, Oconee and Altamaha Rivers. Only minor damage resulted.

EAST GULF OF MEXICO DRAINAGE

Heavy rains on the 7-9th caused the Apalachicola River to rise above flood stage on the 10th to the 17th. The crest on the 12th was 2.4 ft. above flood stage. A second period of heavy rainfall on the 21st-23d caused an additional rise with flooding continuing from the 19th to March 22. The crest on Mar. 8 was nearly 8.5 ft. above flood stage.

Two to 5 inches of rain on the 19th-21st caused moderate flooding on the Choctawhatchee, Cahaba and lower Alabama Rivers in Alabama. The only flooding of any magnitude was along the lower Choctawhatchee River at Caryville, Fla., where flood stage was exceeded by 1 foot. Flooding continued on the Alabama River into March.

Heavy rains on the 20th-21st and moderate rains on the 26-27th caused moderate flooding on the Black Warrior and Tombigbee Rivers. Rainfall during the 1st period averaged about 3 inches over the upper portion and over 4 inches in the middle portion. Rainfall during the latter period averaged between 1 and 2 inches. The greatest flood damage occurred in the Aberdeen-Columbus, Miss., area where residential sections were flooded. Estimates of damage by the Corps of Engineers were placed at $926,600.

Moderate to heavy precipitation during the month, with the heaviest amounts occurring on the 20th, 21st, and 23d, produced flooding on the Chickasawhay and Pearl Rivers in Mississippi. Precipitation during the month averaged from 7 to over 9 inches in the headwaters of the Pearl, Leaf and Chickasawhay Rivers, of which 3 to 6 inches occurred on the 20th, 21st and 23d. Tallahoma and Tallahala Creeks rose 10 to 15 ft. out of their banks at Laurel, Miss. Civil Defense units at Laurel evacuated 75 persons from the flooded area. The evacuees were housed in a church until the creeks subsided. Jackson, Miss., was flooded to a depth of 5 ft. in low lying areas. The heavy rains brought the Pearl River above flood stage from Edinburg, Miss., downstream to Pearl River, La., by the end of the month. The Pearl River reached a stage of 32.1 ft., 14.1 ft. above flood stage, at Jackson on Mar. 3. Elsewhere, downstream flooding was confined to farm and timber lands adjacent to the river. Cattle and equipment were removed from the flooded area before they were inundated by the rising river. Estimates of damage by the Corps of Engineers were placed at $962,300.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--Precipitation during February in Minnesota and Wisconsin was above normal for the second consecutive month. The heaviest precipitation occurred over eastern Minnesota, Wisconsin and northeastern Iowa. Observed totals ranged from one inch to over 3 inches.

The snow cover in the Upper Mississippi Basin at the end of February was considerably more than last year but less than in 1969, except in Wisconsin. Snow depths on Feb. 28, 1971, compared with that of other years are given in the following table:

COMPARATIVE SNOW DEPTHS (INCHES)

STATION	1971	1970	1969	1968	1967	1966	1965	1964	1963	1962	1961	1960	1959	1958	1957	1956

Major flooding occurred on the Maquoketa and Wapsipinicon Rivers in Iowa, the Pecatonica River in Wisconsin and Illinois, and on the Rock River in Illinois. Record stages were reached on the lower Rock at Joslin and Moline, Ill., on the 23d and 24th. The previous record stage at Joslin was 16.3 ft. on Feb. 13, 1966, compared to 17.7 ft. this year. The previous record stage at Moline was 14.9 ft. on Mar, 11, 1929, compared to 15.2 ft. in 1971. This major overflow was due to snowmelt accompanied by 1 to 2 inches of precipitation on the 18-19th. The flooding was affected by the movements of an unusually thick ice cover.

Heavy precipitation on the 17-18th plus snowmelt runoff caused flooding on streams in the Iowa, Skunk and Des Moines River Basins. Flooding began on the North Skunk at Sigourney, Iowa, and on the Raccoon at Perry, Iowa, on the 18th. The North Skunk and Skunk Rivers were out of their banks on the 18th-21st. Crests on both rivers were 2.5 to 5 ft. above flood stage. Near Cambridge, Iowa, ice jams caused the highest overflow since 1947. The Skunk River remained above flood stage at Oskaloosa and Brighton, Iowa, through the end of the month. The Iowa River with crests near 4 ft. over flood stage continued in flood at Wapello, Iowa, into March. Crests on the North Raccoon, South Raccoon, and Raccoon Rivers were 5.5 to 7 ft. above flood stage. The North Raccoon River remained above flood stage at Jefferson, Iowa, to Mar. 1, but the other streams receded within their banks on the 25th. Considerable ice action along these rivers during the high water caused the water level to fluctuate considerably as the ice jams formed and broke up. Crests along the Des Moines River were 1 to 3 ft. above flood stage. Flooding was generally restricted to low-lying

farm lands. Several homes at lower elevations were evacuated.

Moderate to heavy rains (1 to 2 inches) on the 21st-22d caused minor to moderate flooding in central Illinois. Substantial flooding occurred on the Big Muddy River which crested nearly 10 ft. above flood stage at Murphysboro, Ill., on the 27th. The Illinois River at Havana and Beardstown, Ill., crested slightly above bankfull stage early in March.

Very minor flooding occurred along the Mississippi River toward the end of the month from Hannibal, Mo., downstream to Winfield, Mo. There was also some local flooding upstream at Keithsburg, Ill., and Burlington, Iowa, between the 22d and 26th.

Missouri Basin.--Some lowland flooding occurred in the upper Missouri Basin in Montana from the 14th through the 17th due to melting snow and ice jams. Ice jammed on the Milk River downstream from Eastern Crossing and above Fresno Reservoir, flooding low lying areas on the 14th and 15th. Beaver Creek near Havre, Mont., rose above its banks and flooded the golf course. Peoples Creek near Dodson, Mont., overflowed and covered U.S. Highway 2 for a brief time. Spring Creek at Lewistown, Mont., overflowed during the weekend of the 13th. The Musselshell River in the Musselshell and Melstone, Mont., areas overflowed covering several county roads and fields. Two families near Musselshell were forced to evacuate their homes for a brief period.

Lowland flooding due to ice jams developed on the lower Yellowstone River during the 3d week of February. Flooding was confined mainly to farms along the river. Several ice jams were noted in the area from about 20 miles below Billings, Mont., downstream to the mouth of the river. Preliminary reports indicate that 200 to 300 head of cattle were drowned, several farm homes flooded and two bridges destroyed. Eighty trailer homes were evacuated in the Glendive, Mont., area. The total damages were estimated at $221,000.

A combination of warm temperatures, heavy rain, melting snow, frozen ground and ice jams caused considerable flooding in western Iowa, western Missouri and northeastern Nebraska. Mild weather from the 14th through the 19th with general rains on the 18-19th resulted in snowmelt and rapid runoff. Rising streams caused ice to break up. Most of the lowland flooding was due to ice jams. Rainfall ranged from 1 to 3.2 inches. Bazile Creek at Niobrara, Nebr., crested at a stage of 20.42 ft., the highest stage ever recorded. The previous highest stage of record was 19.96 ft. on June 16, 1957.

One person was killed when a bridge collapsed with his car on it near Center, Nebr. Some lowland flooding occurred on the Vermillion River at Wakonda, S. Dak. The lower reaches of the Rock and Little Rock Rivers in Iowa rose 2 to 3 ft. above flood stage on the 19th. The lower Big Sioux River from the mouth of the Rock River to below Akron, Iowa, ran 1 to 4 ft. over bankfull stage on the 21st to the 22d. The North Branch Elkhorn River at Pierce, Nebr., reached a record crest of 16.0 ft. on the 19th. The previous high water was 15.3 ft. in April 1881. Most other places along creeks and streams reported near record crests. Many communities without gages or records indicated the highest water in memory. Unprecedented lowland flooding occurred along the Elkhorn and other portions of the North Branch. Ice jams caused the Elkhorn River to cut numerous new channels, mainly in the West Point-Wisner, Nebr., region. A blizzard struck northeastern Nebraska on the morning of the 22d depositing up to 17 inches of snow over much of the flooded area. Snowmelt on the 24-25th caused additional overflow along the North Fork and Elkhorn and in the vicinity of ice jams in the Elkhorn. By the end of the month, most ice jams had been cleared and most streams were near or below normal. The heaviest damages were reported in the Elkhorn Basin in northeastern Nebraska. A total loss of approximately $5 million was reported by early March.

Warm temperatures beginning around the 10th caused the snow to melt rapidly and the ice in the rivers to break up in southwestern Iowa and northwestern Missouri. This warm weather was preceded by a snow and ice storm on the 4th and 5th which produced snow amounts of 4 to 6 inches over northwestern Missouri, southeastern Nebraska and southwest and south-central Iowa. This same storm produced a combination of snow, freezing rain and rain over west-central and central Missouri. Water amounts ranged from 3/4 to 1 1/4 inches. The Nishnabotna, as well as the East and West Forks in southwest Iowa, and the Grand River in central Missouri rose out of their banks on the 18-19th. The most extensive flooding occurred on the Nishnabotna River at Hamburg, Iowa, on the 18th-22d. The crest on the 19th was 27.0 ft., 9 ft. above bankfull stage. This was the highest stage reported in the last 20 years. Much ice and water was reported over roads and fields. Another heavy snowstorm on the 21st to the 23d produced snow amounts of 3 to 7 inches over the northern half of Missouri, and 6 to 12 inches over extreme northeast Kansas, southeast Nebraska and south-central and southwest Iowa. Just as most rivers were receding, the partial melting of the new snow caused the streams to rise again. Most rivers rose to around three-quarters to near bankfull stages, with the Grand River at Chillicothe and Sumner, Mo., reaching slightly above bankfull stage.

Snow melt and rain on the 18th produced substantial rises on the Big and Little Blue Rivers in Nebraska. Minor overflows occurred on Lincoln and Turkey Creeks, tributaries of the Big Blue in Nebraska, on the 20th-22d. The ice which was very heavy in the Big Blue Basin did not break up during this rise. A severe snow storm on the 21st to the 23d produced snow averaging 10 to 15 inches deep over the Blue Basin in Nebraska, the Smoky Hill below Cedar Bluff Reservoir, the Republican below Harlan County Lake, the upper Marais des Cygnes and most of the Kansas drainage.

The water equivalent of the snow, where it was 10 inches or more deep, was generally 1.5 to 2 inches and locally 2.5 inches. This snow was gradually depleted by the end of the month. The remaining snow was in a 50 to 70 mile strip from about Lincoln, Nebr., to Ellsworth, Kans., with average depths from 2 to 5 inches.

Minor flooding occurred on the Little Osage River near Horton, Mo., on the 28th and on the Osage River at Schell City, Mo., from the 26th into March.

The main stem of the Missouri River near Nebraska City, Mo., was near or slightly above bankfull stage from the 8th to the 13th due to ice fluctuations. The ice was extremely heavy after the very cold temperatures during the first 10 days of the month. Ice bridges from just north of Kansas City to about Nebraska City began to break up on the 18th and 19th. This resulted in the river rising to near or slightly above bankfull stage at most locations from around Nebraska City downstream to the mouth by the 25th.

Ohio Basin.--Minor flooding occurred in the upper portion of the Hocking River Basin in Ohio on the

22d-24th. This flooding was due to about 1.5 inches of rain on the 21st-22d. Damage was minor and consisted mostly of cutting off of highways and flooding of low valley land.

Minor flooding occurred on the 22d along the downstream reaches of the Miami, Little Miami and Whitewater Rivers in southwestern Ohio and southeastern Indiana. By the morning of the 24th, all were below flood stage.

Heavy rain on the 3d to the 5th over the lower Ohio Basin caused flooding on some streams in the Wabash and Cumberland Basins. Most of the streams were falling and at low levels prior to this rain. While extensive bottomland flooding occurred, little damage resulted. Three to 5 inches of snow fell over the lower Ohio Basin on the 7th and 8th followed by a warming trend and an average rainfall of about one inch on the 12th. Most of the rivers continued to rise, especially the Ohio which reached flood stage at Shawneetown, Ill., and Fords Ferry, Ky., on the 11th.

During the last 10 days of the month, the temperature averaged well above normal. Rainfall amounts between 1 and 2 inches occurred over the lower Ohio Basin on the 21st-23d. Amounts over 2.5 inches occurred along the upper Ohio Valley above Addison, Ky., (Dam 45). These rains caused considerable flooding in the lower portion.

White Basin.--The only flooding in the White Basin during February was on the Cache River at Patterson, Ark. It was receding in the beginning of the month from the January rains and fell below flood stage on the 1st. Additional rain on the 12-13th caused the Cache to rise above flood stage on the 14th. Additional rain on the 21st-22d caused the river to remain above flood stage the remainder of the month. It crested on Mar. 1, 1.6 ft. above flood stage. No damage resulted from the flooding.

Lower Mississippi Basin.--Heavy rains (2 inches) on the 21st caused sharp rises on the St. Francis River below Wappapello Reservoir to above flood stage on the 22d-25th at St. Francis, Ark., and Fisk, Mo., respectively. It receded below flood stage at Fisk on the 28th. Flooding continued at St. Francis to Mar. 4.

The Big Black River rose sharply from the heavy rains on the 23d and exceeded flood stage during the afternoon of the 26th. The river crested 10.3 ft. above flood stage at Bovina, Miss., on Mar. 4. Lowland flooding was general along the lower portion of the river from Pickens, Miss., downstream.

The Lower Mississippi River at Caruthersville, Mo., rose above flood stage on the 25th. It continued to rise into March. The stage was the highest observed since May 1970.

PACIFIC SLOPE DRAINAGE

Sacramento Basin.--The Sacramento River at the Tisdale Weir, Calif., continued overflowing from Jan. 16 to Feb. 7. Releases from major reservoirs were held at a minimum throughout the month.

Northern Coastal Basins.--The Snohomish River at Snohomish, Wash., and the Skagit River at Mt. Vernon, Wash., receded below flood stage on Feb. 1. The crests on Jan. 31 ranged up to 2.4 ft. above flood stage. Only minor damage resulted.

Note: All observations scheduled at 1200 G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

\+ Observations for these stations are scheduled at 0000 G.C.T.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun. FEBRUARY 1971

* Values corresponding to true solar noon

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska.

FEBRUARY 1971

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	-87	-86	-83	-21	-16	-17	-32	- 8	7	-78	-42	-11	-23	-16	-16	-45	-40	-39	-33	-42	-32	-33	-70	-124	-104	-75	-11	-18				-41

The measurement is made with a Csiro Funk net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

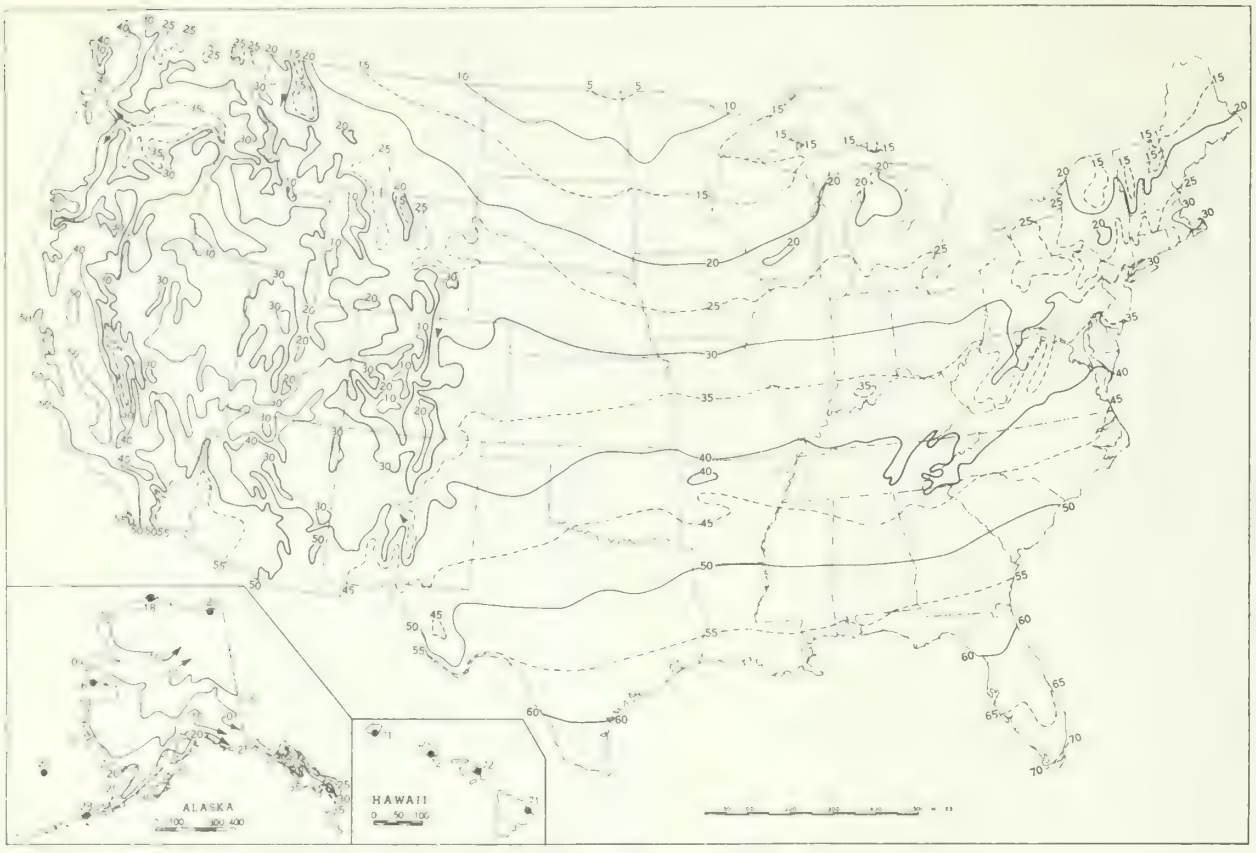
SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (λ 3900 A) at Ames, Iowa.

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg
Langleys. . .	8.78	5.92	4.83	2.27	11.54	11.64	11.44	11.94	11.25	10.06	10.20	10.46	10.85	6.02	10.36	5.72	10.85	.88	3.35	4.63	6.41	3.65	12.43	14.7[illegible]	14.31	2.79	-	-				8.35

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA



These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code as defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units Milli-atmo-cms.

The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of unit cross-sectional area extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone is usually expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 3.5 millimeters thick. The code 4 5 designates the type of measurement made

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), February

B. Temperature Departure from 30 - Year Mean (°F 1931-60), February 1971.

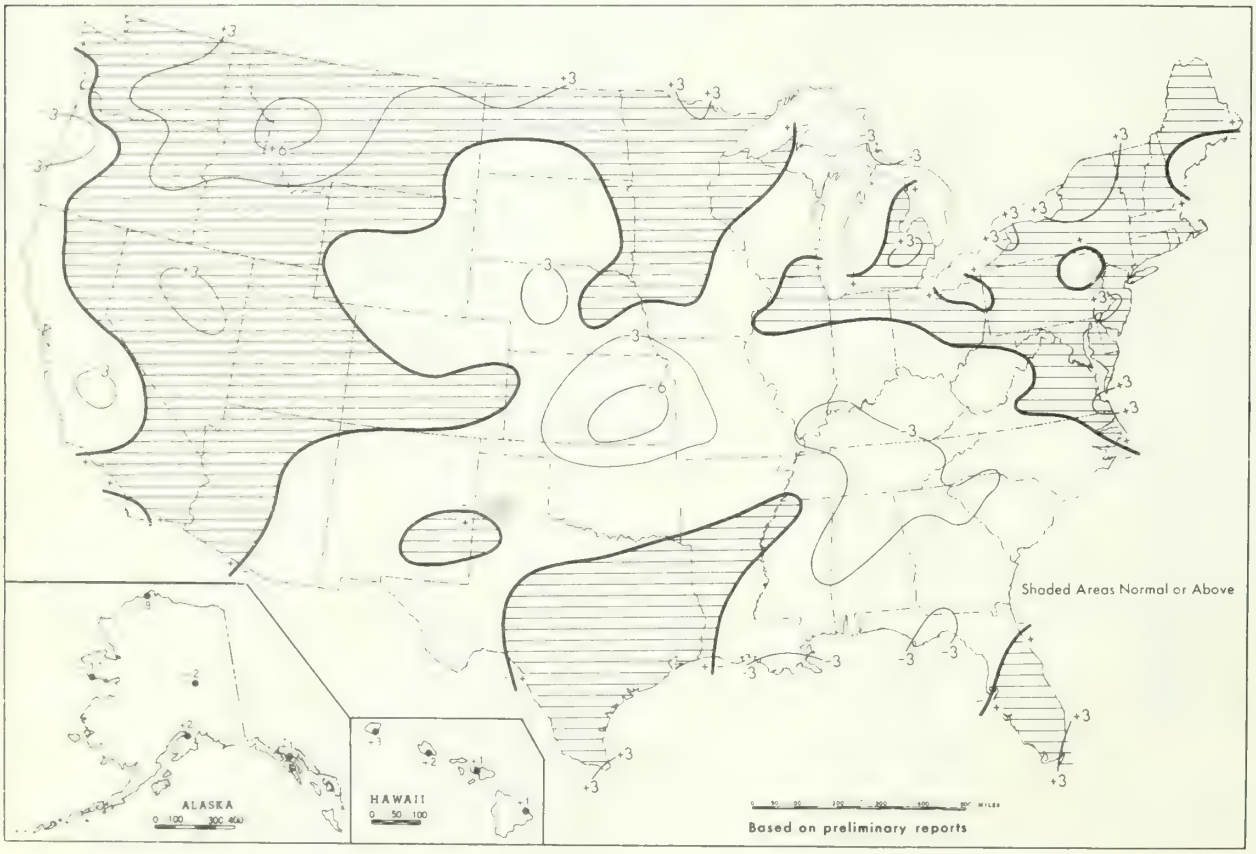

Chart II. Total Precipitation (Inches), **February 1971.**

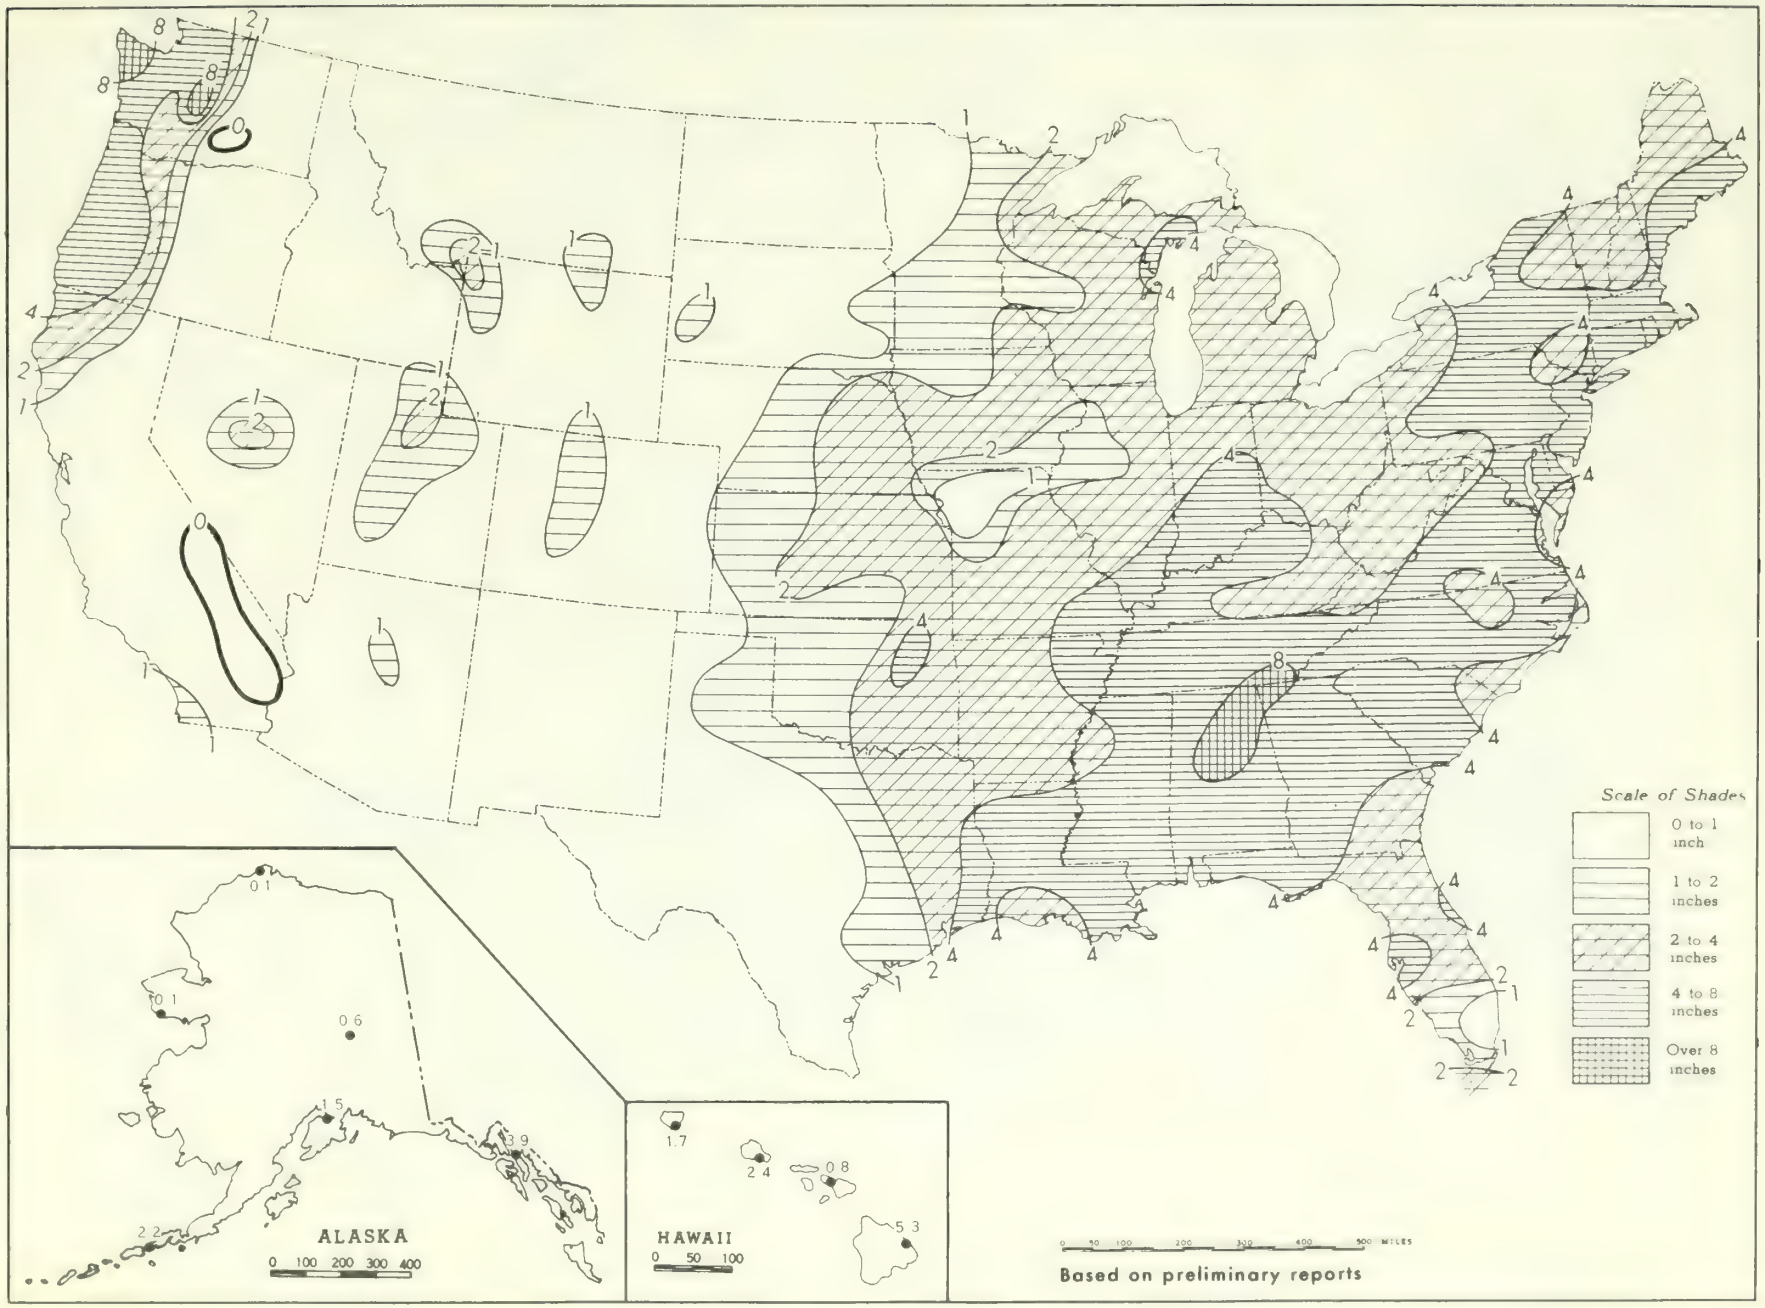

Chart III. Percentage of Normal Precipitation, February 1971.

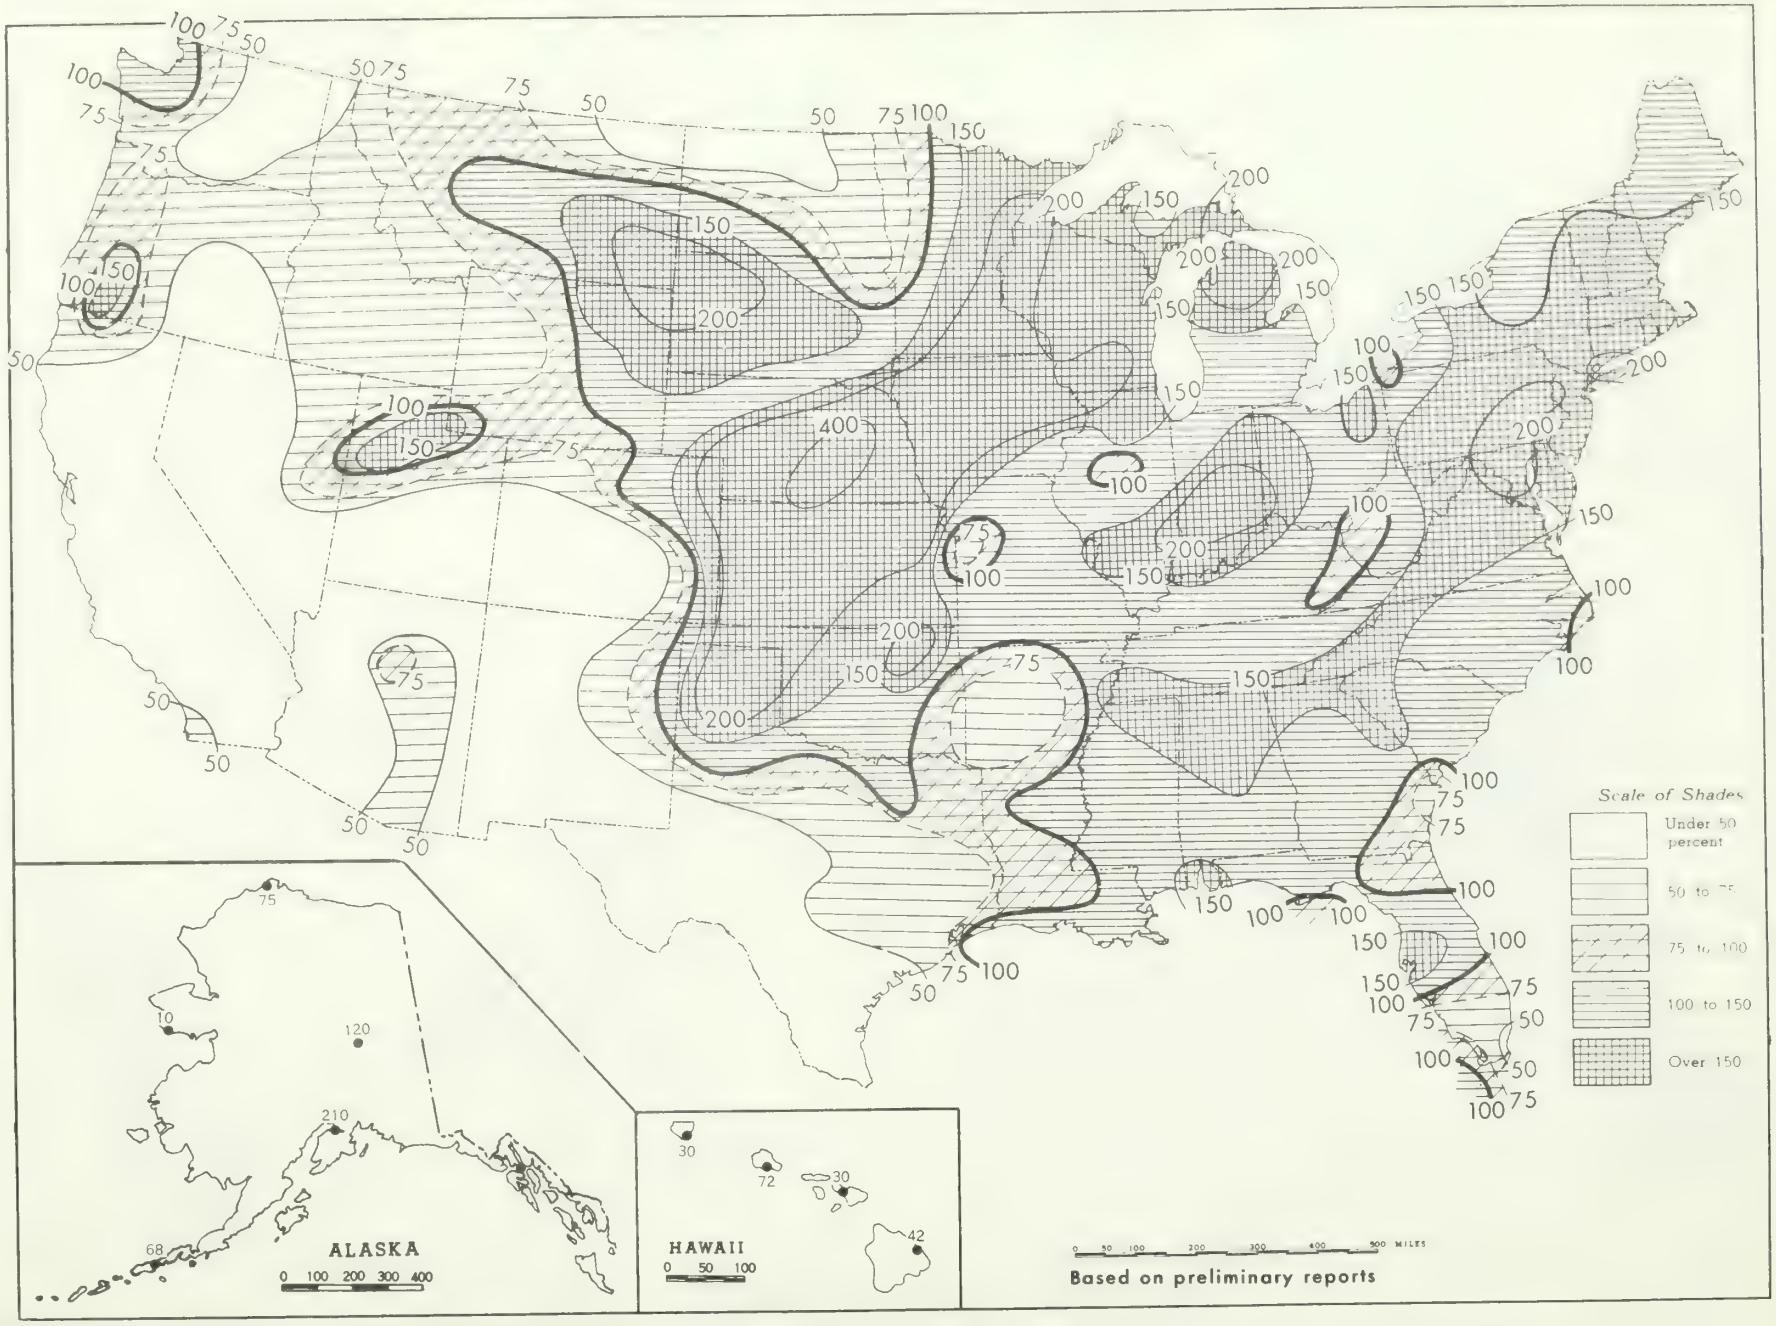

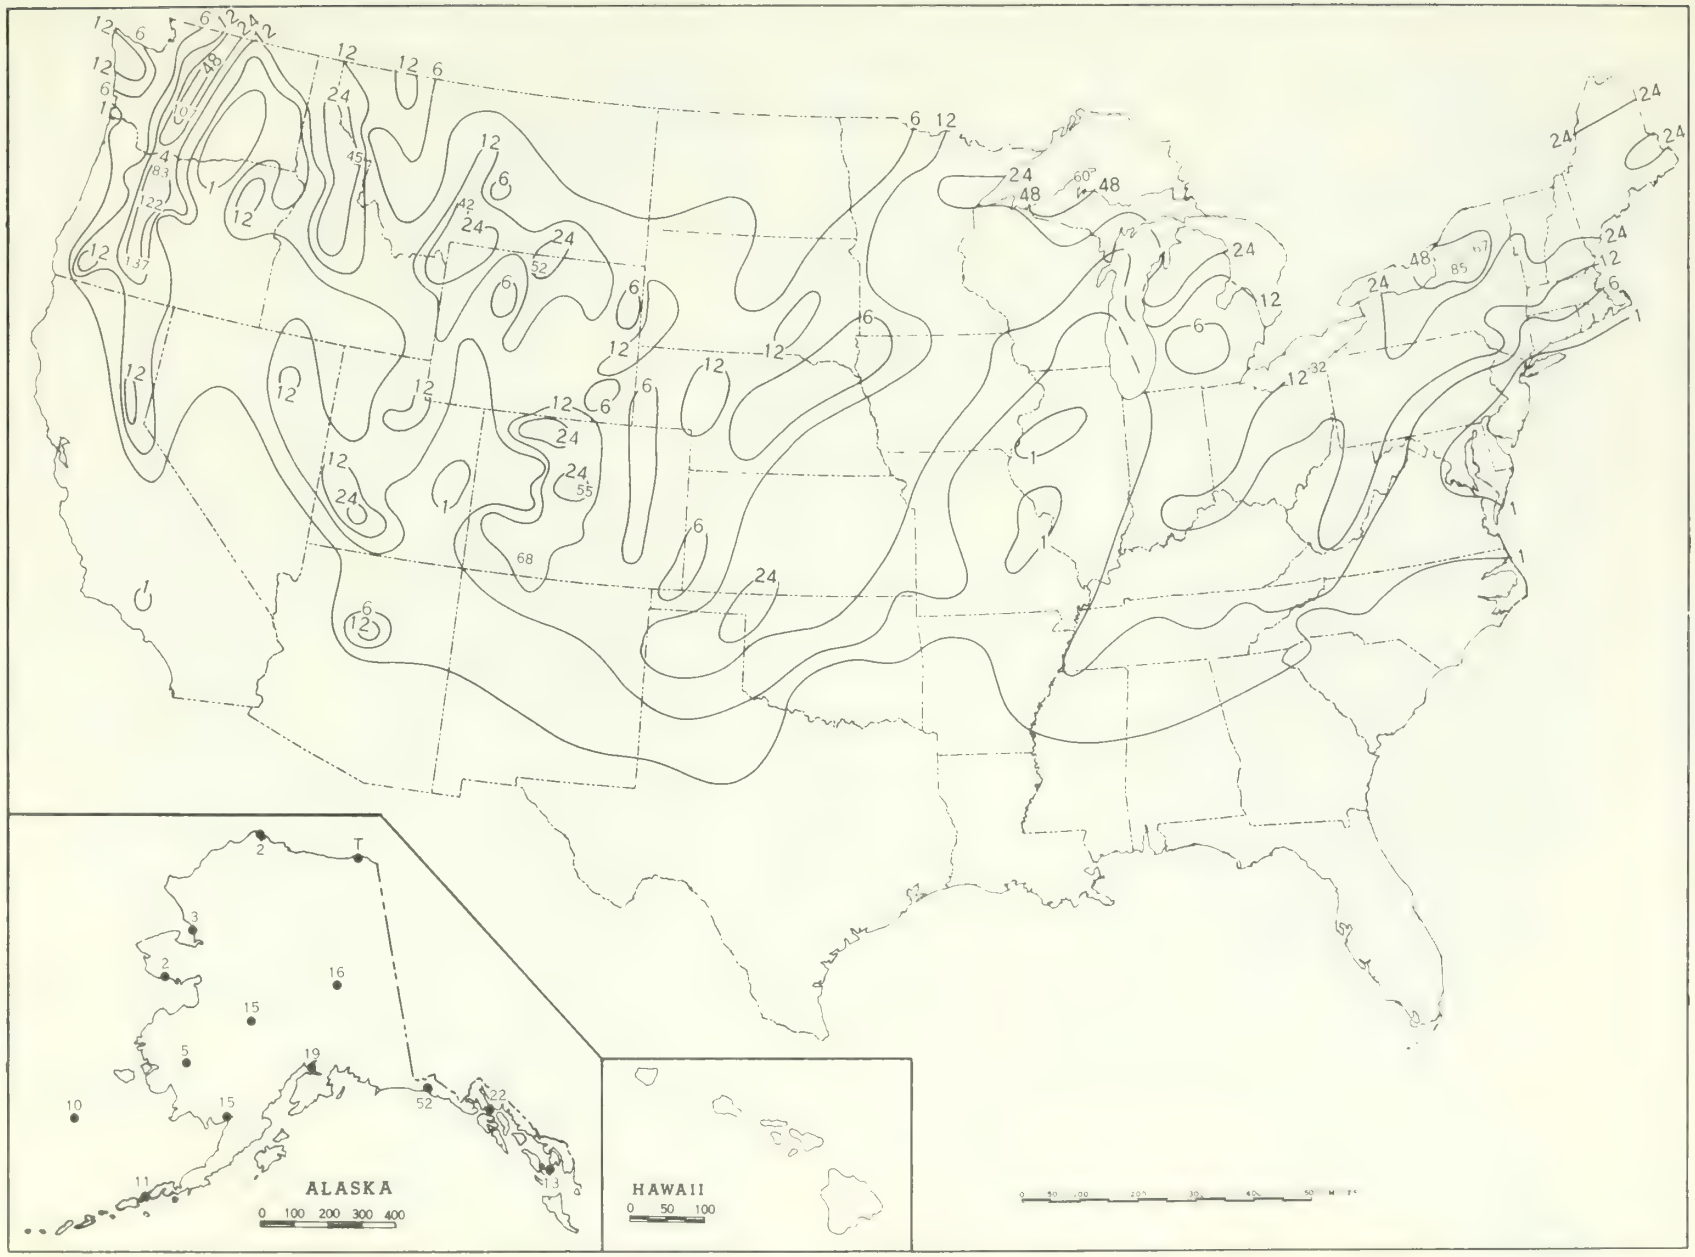

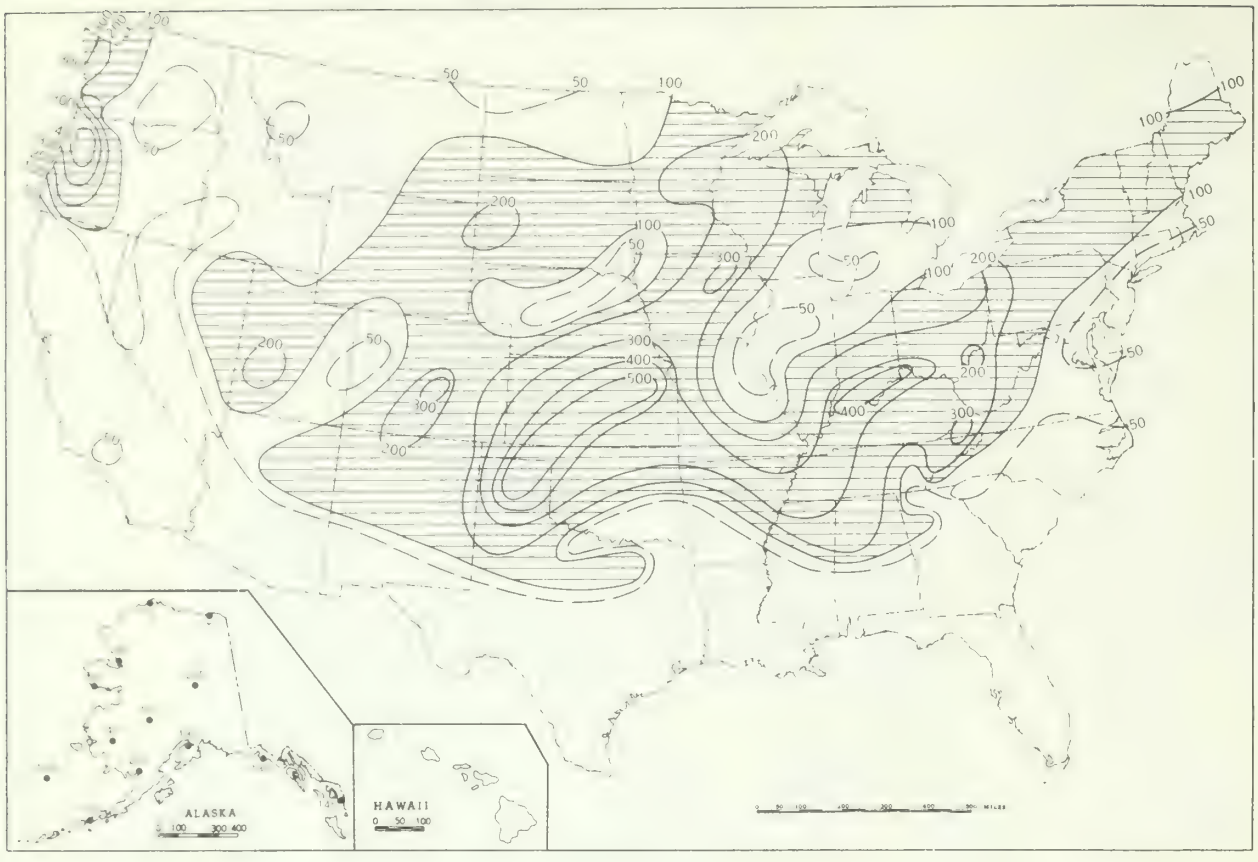

Chart IV. Total Snowfall (Inches), **February 1971.**

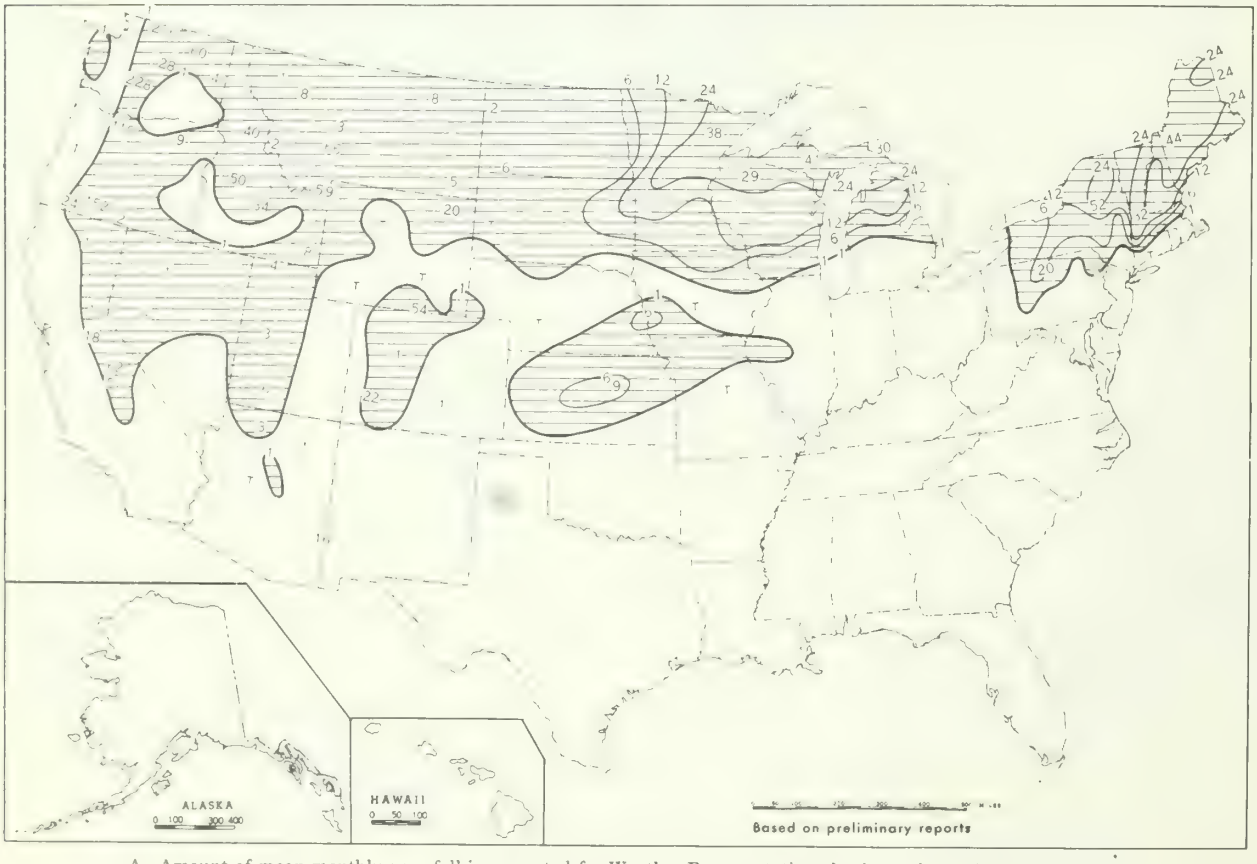
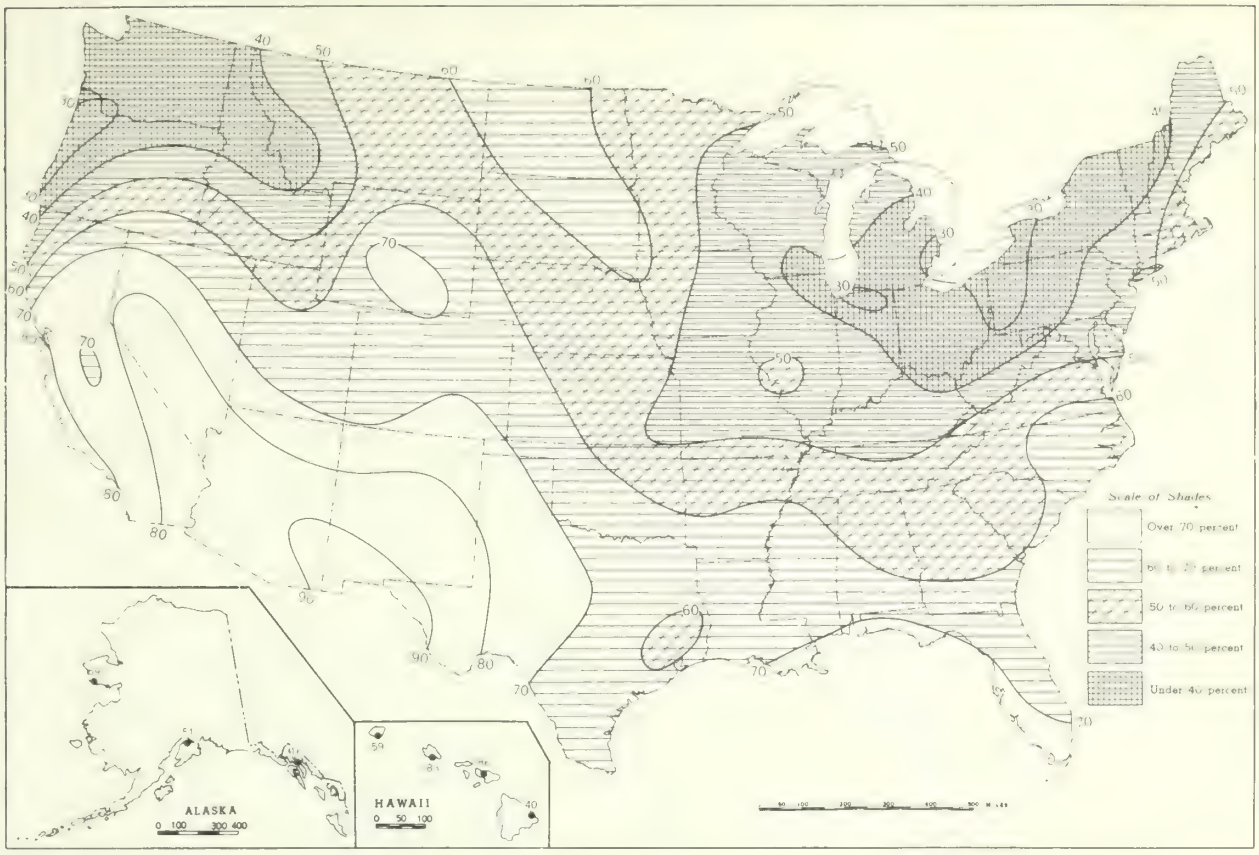
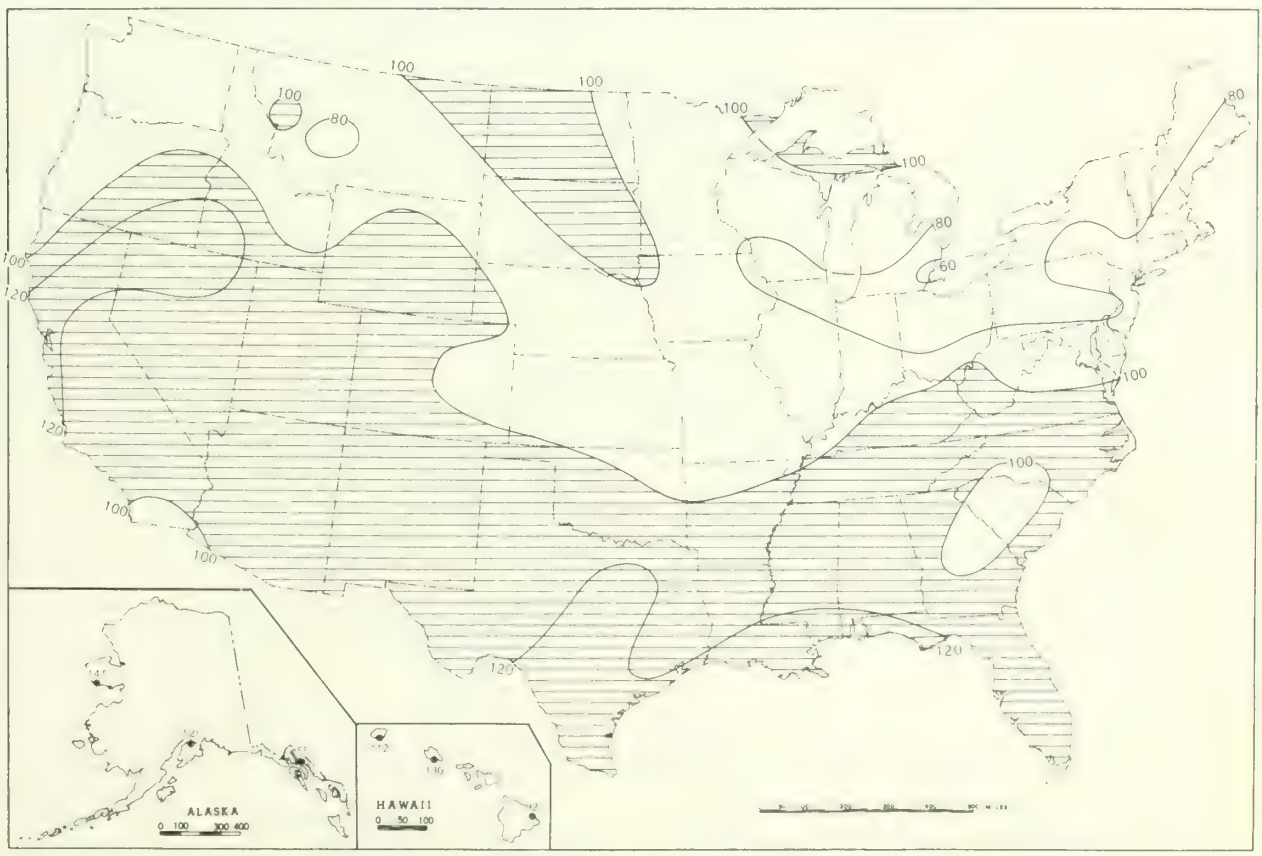


This is the total of unmelted snowfall recorded during the month at Weather Bureau and selected cooperative stations. This Chart and Chart V are published only for the months of November through April, although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year

Chart V. A. Percentage of Mean Monthly Snowfall, February 1971.

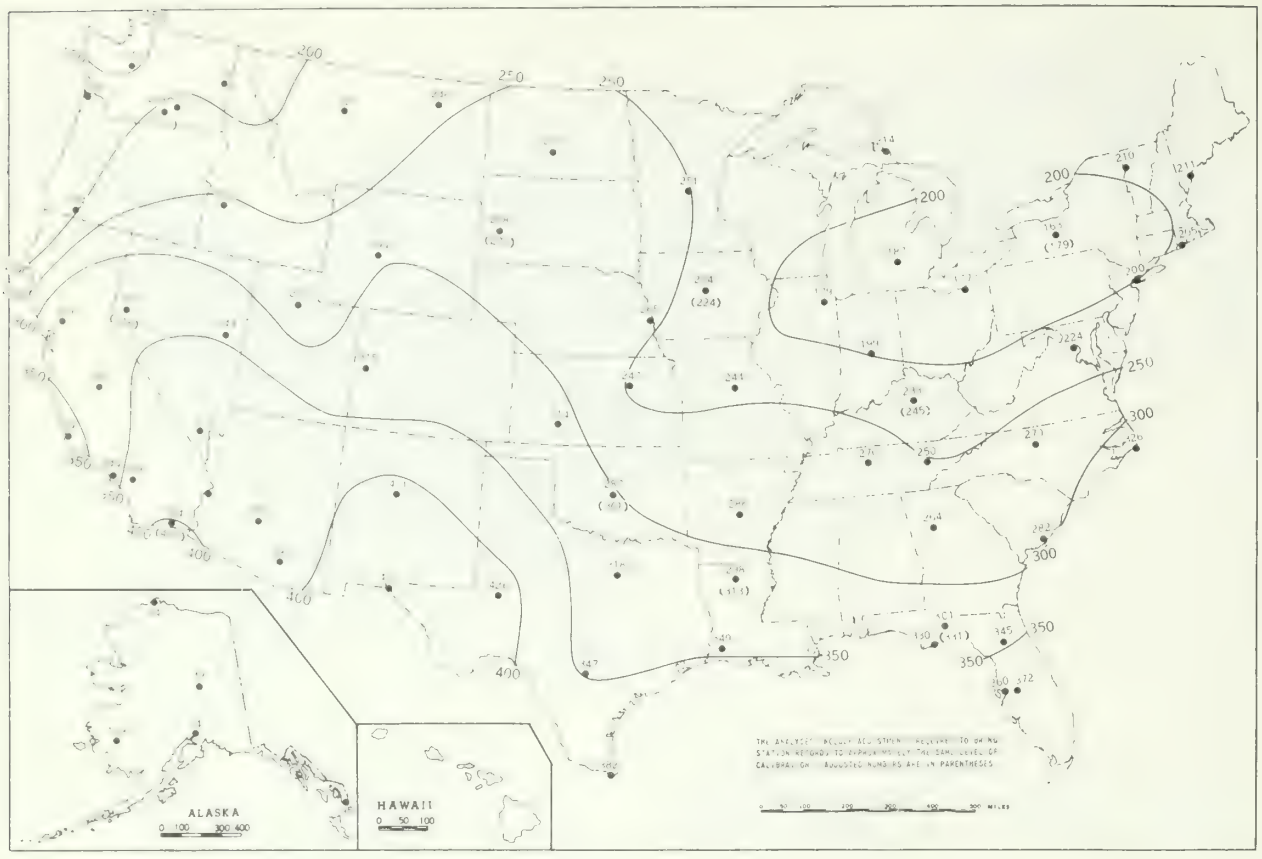


B. Depth of Snow on Ground (Inches), 7:00 a.m. E. S. T., March 1, 1971.

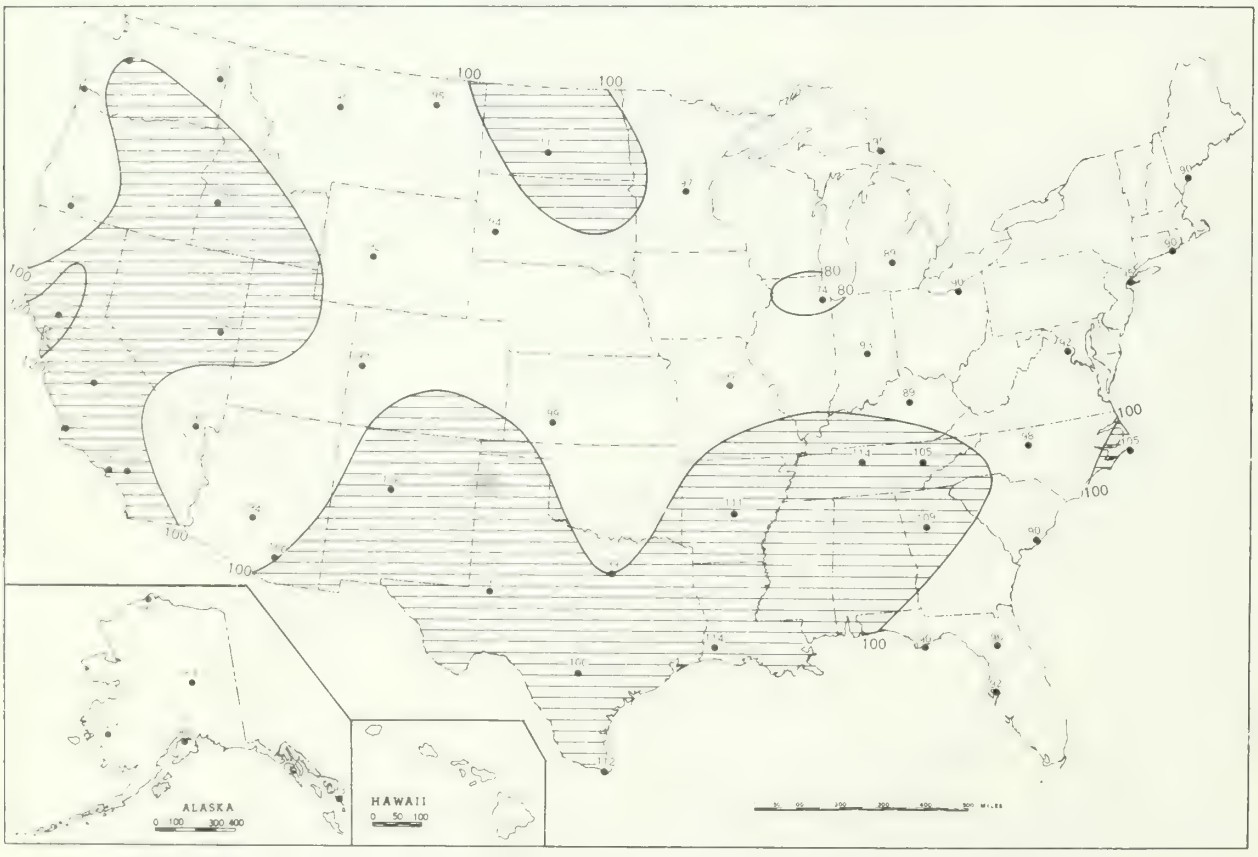


A. Amount of mean monthly snowfall is computed for Weather Bureau stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a.m. E.S.T., of the Monday nearest the end of the month.
It is based on reports from Weather Bureau and selected cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, February 1971.

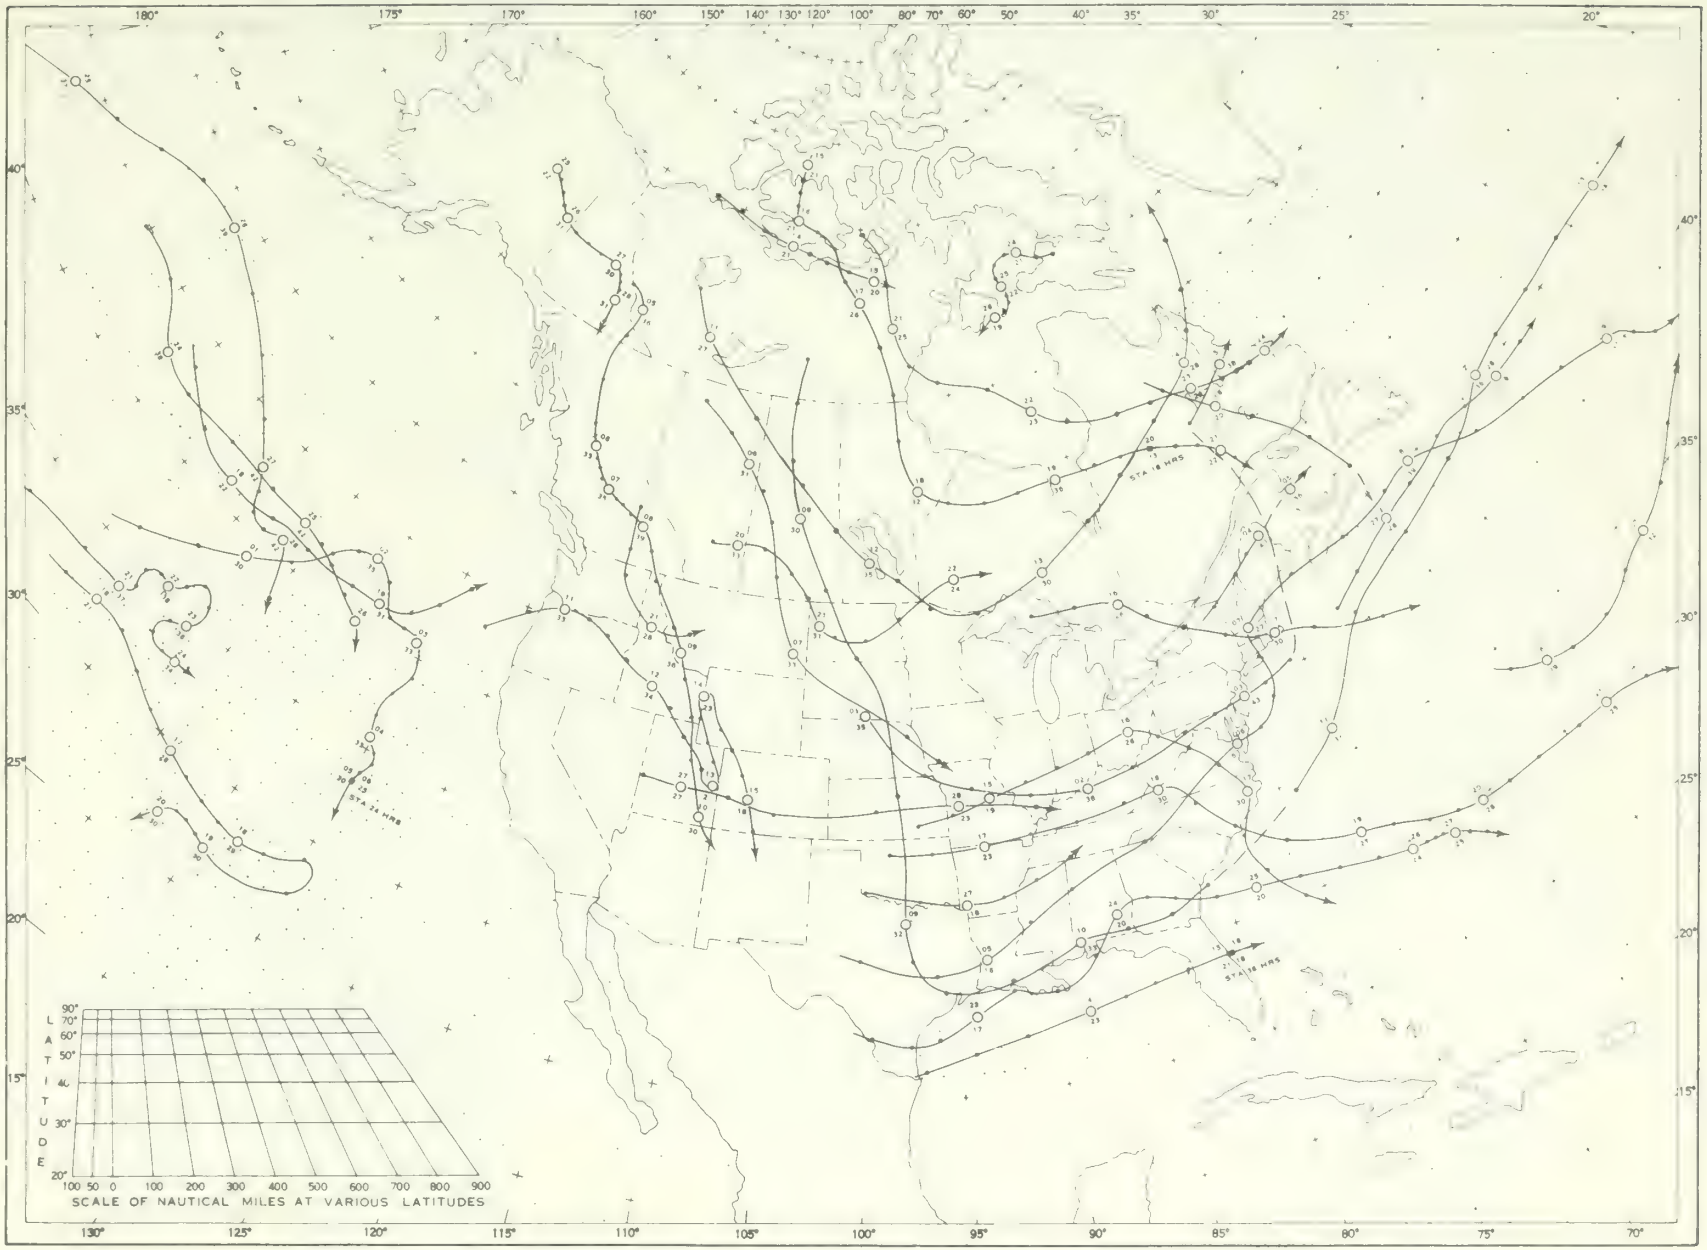


B. Percentage of Mean Monthly Sunshine, February 1971.

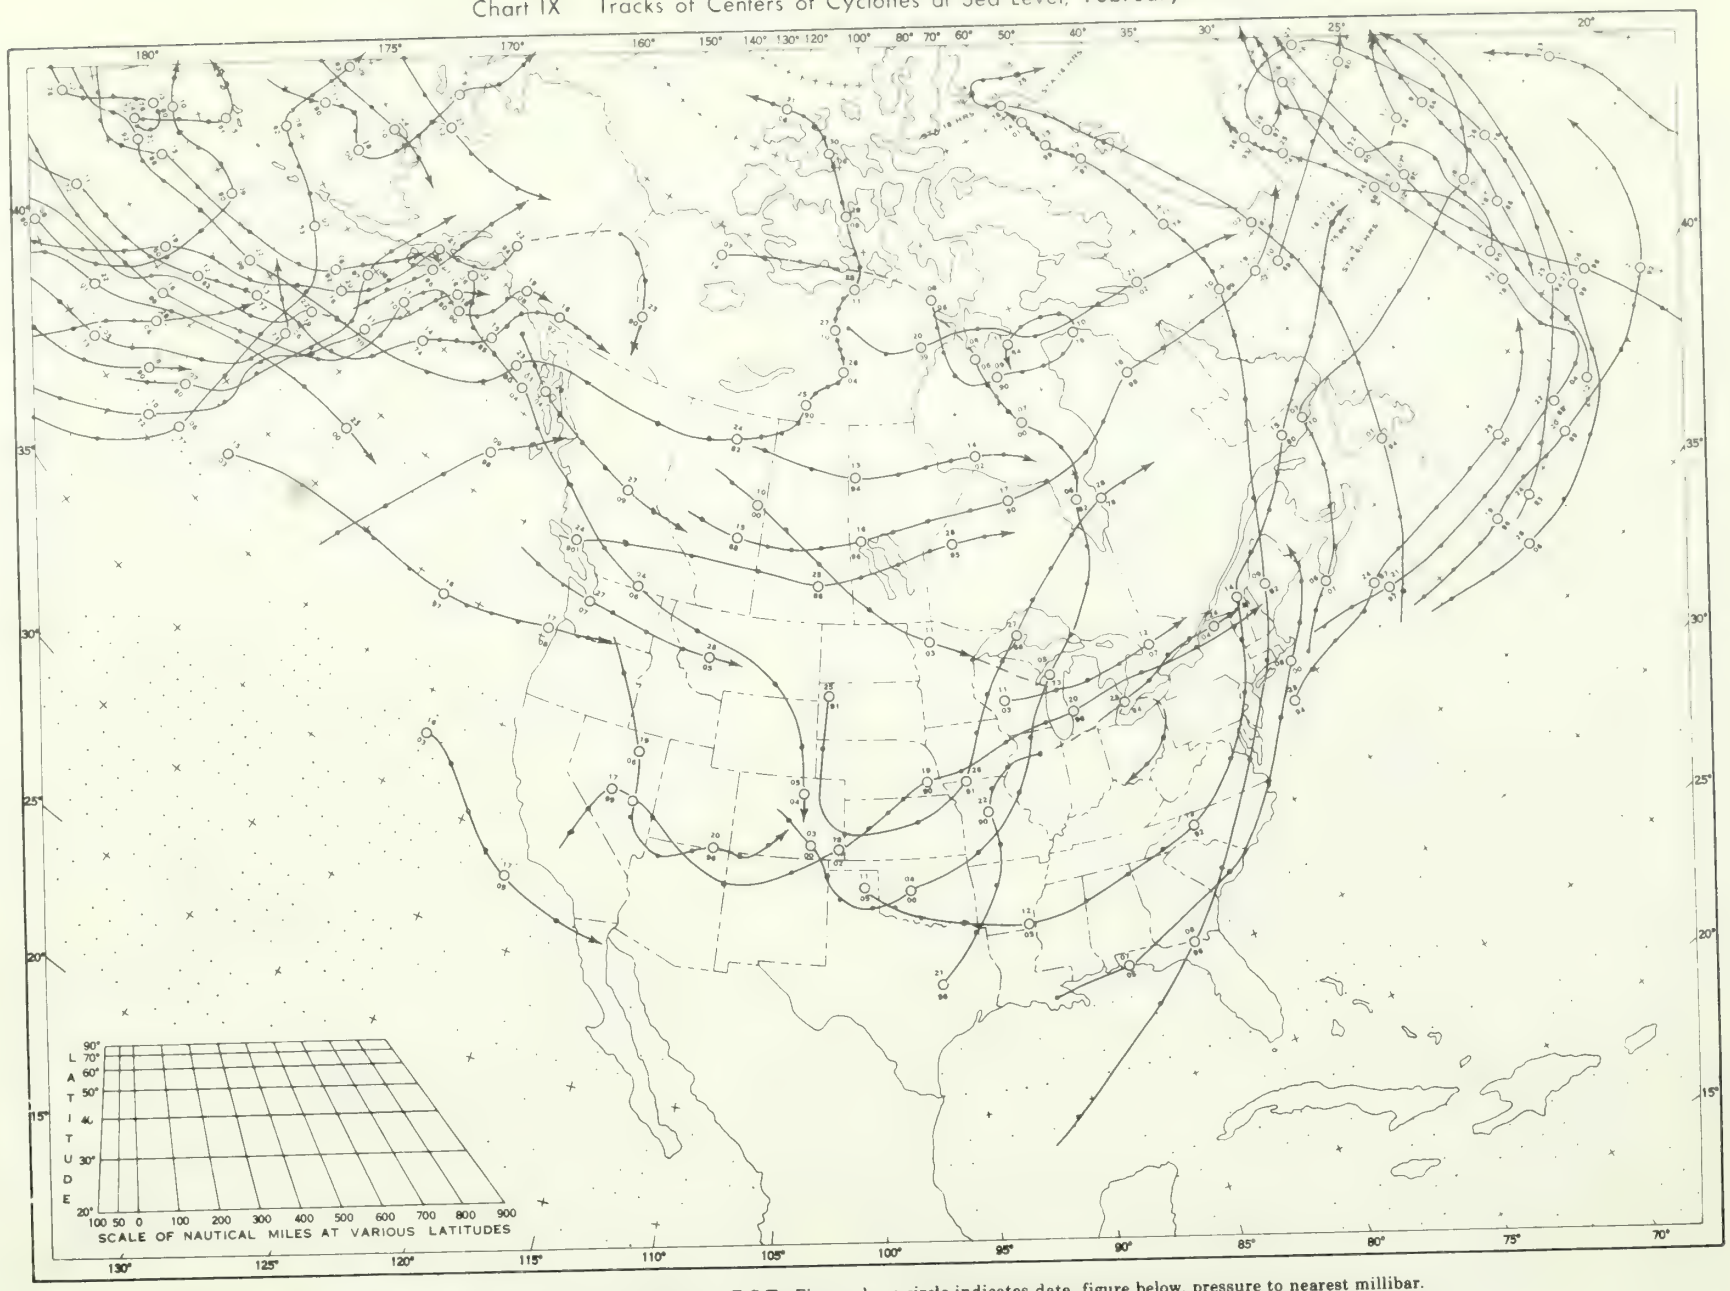


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, **February 1971.**

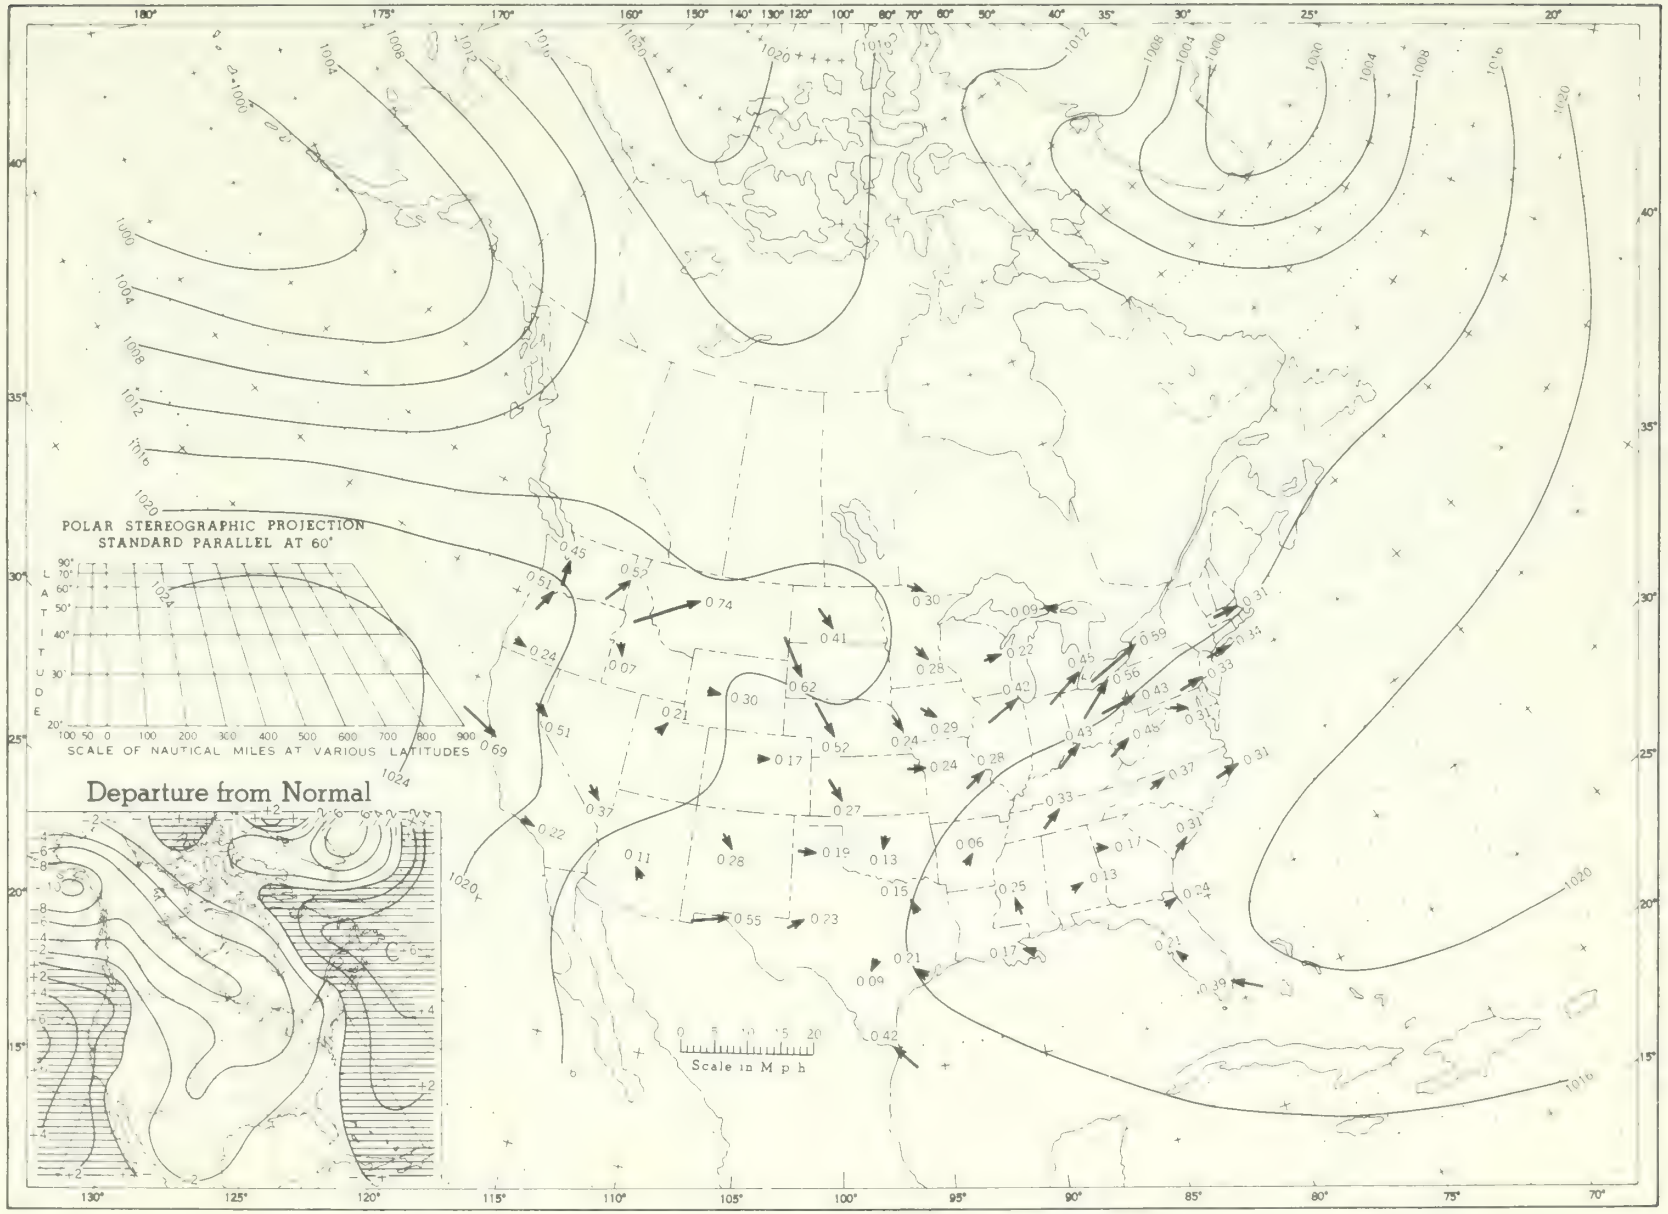


B. Percentage of Mean Daily Solar Radiation, **February 1971.**



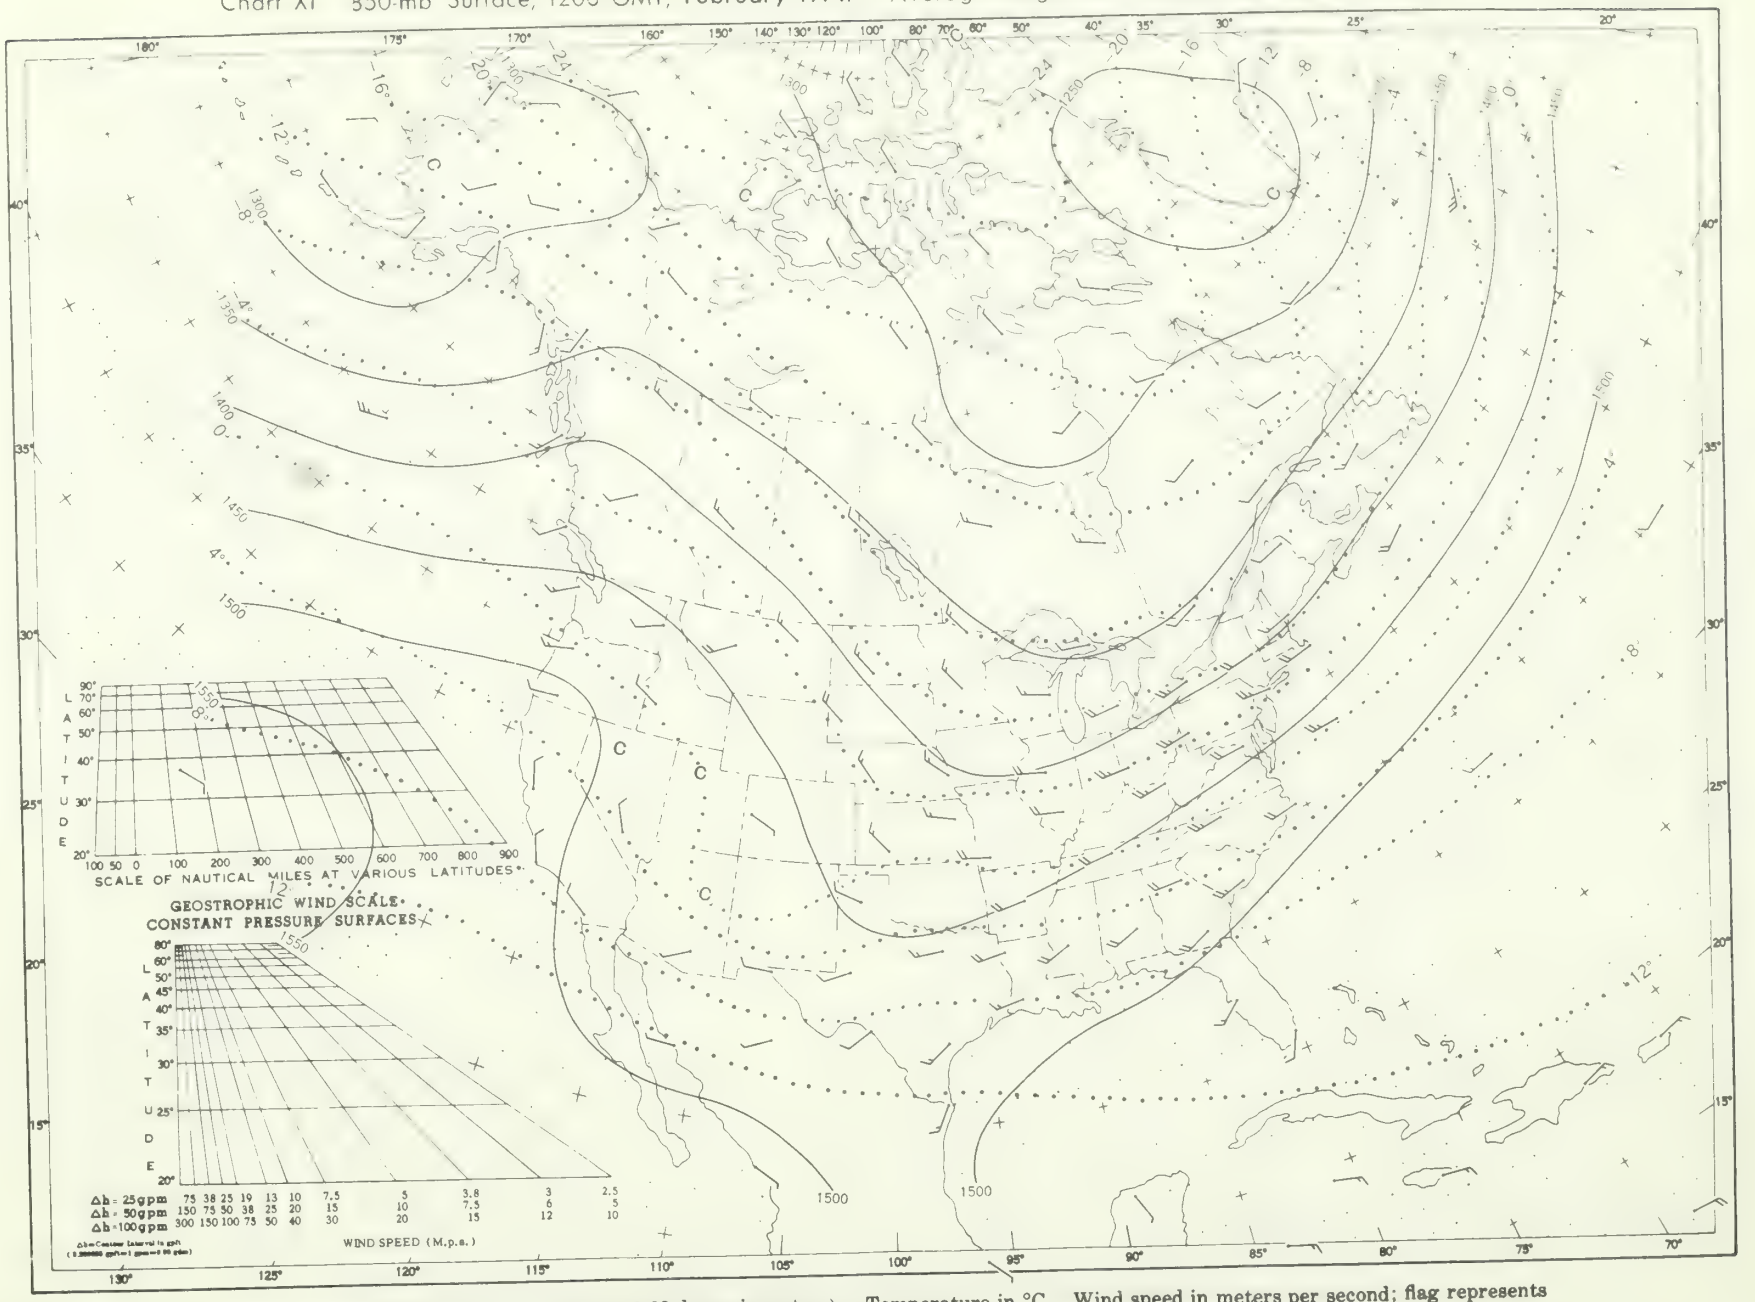
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII Tracks of Centers of Anticyclones at Sea Level, February 1971.



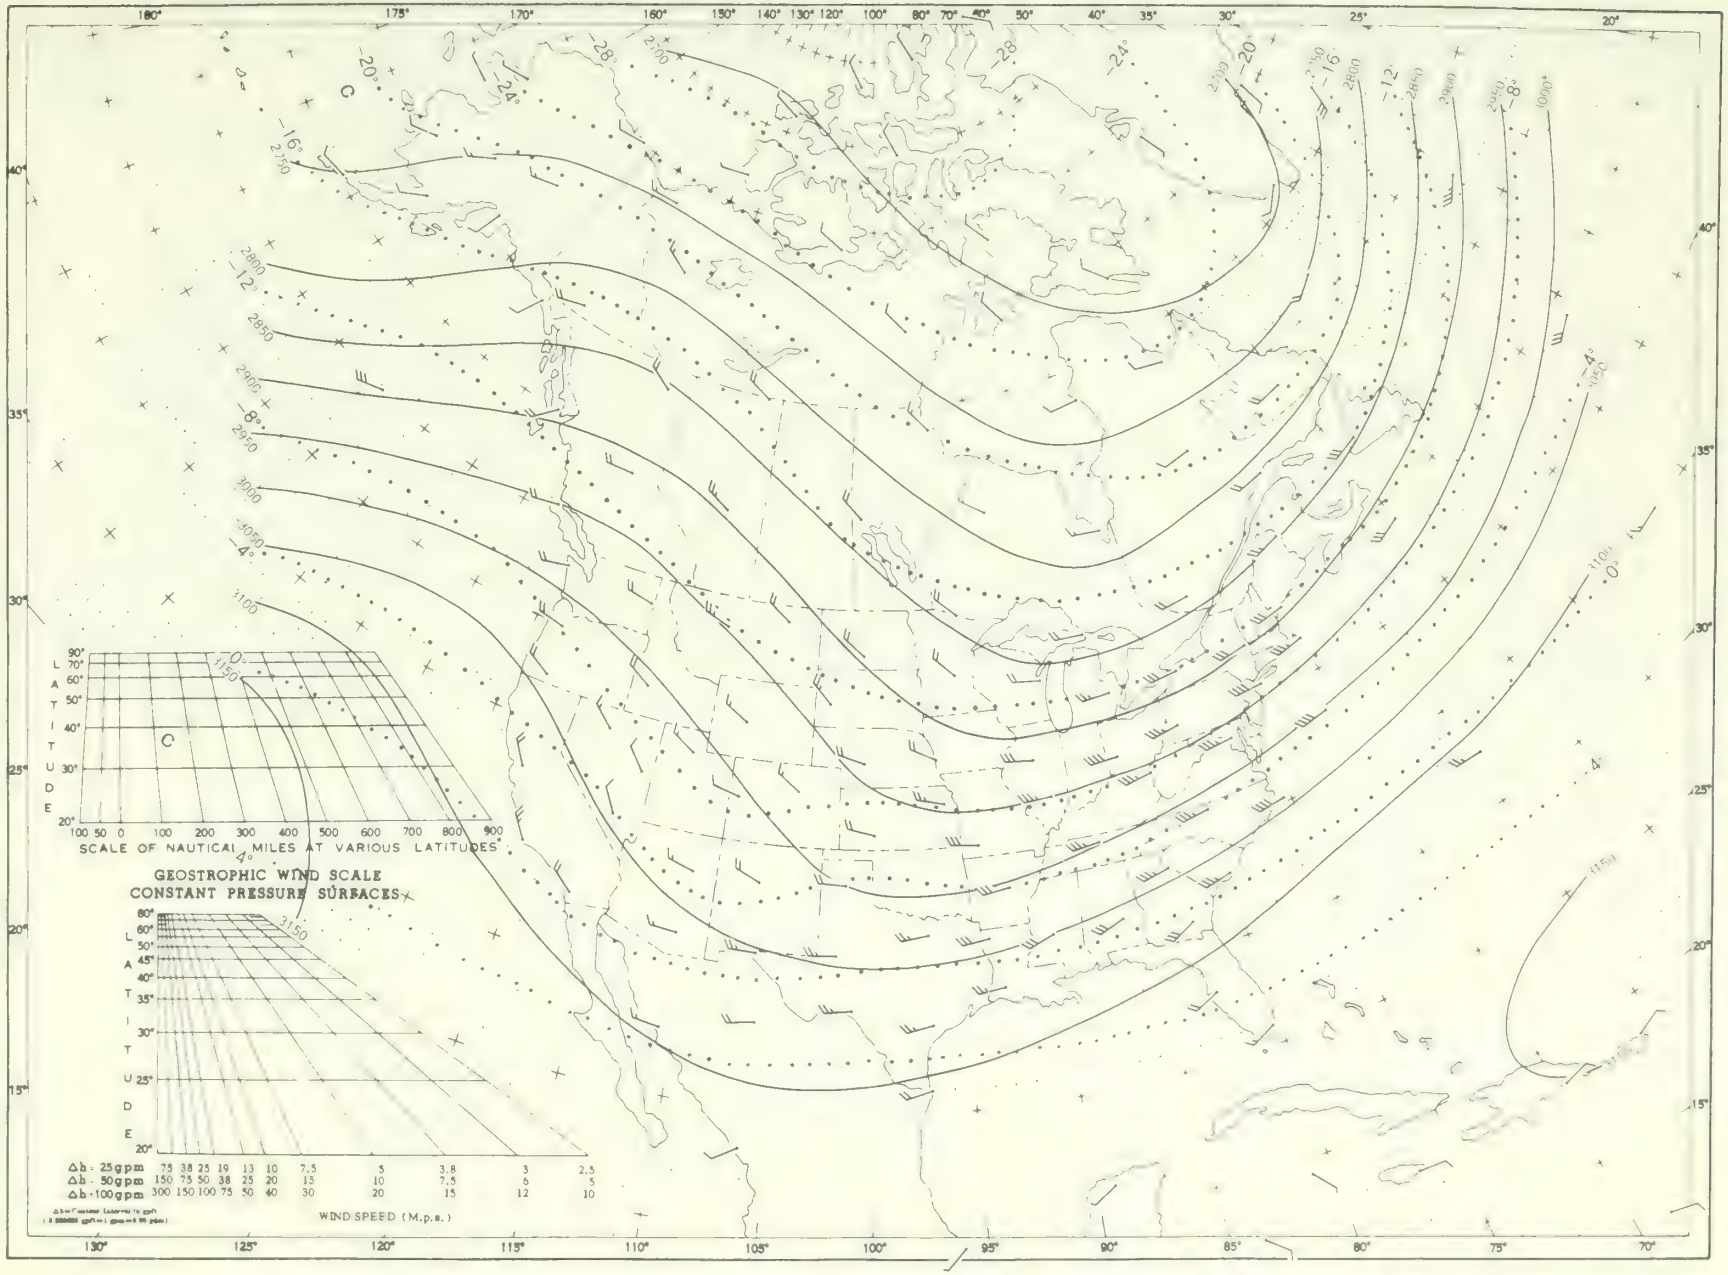
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX Tracks of Centers of Cyclones at Sea Level, February 1971.



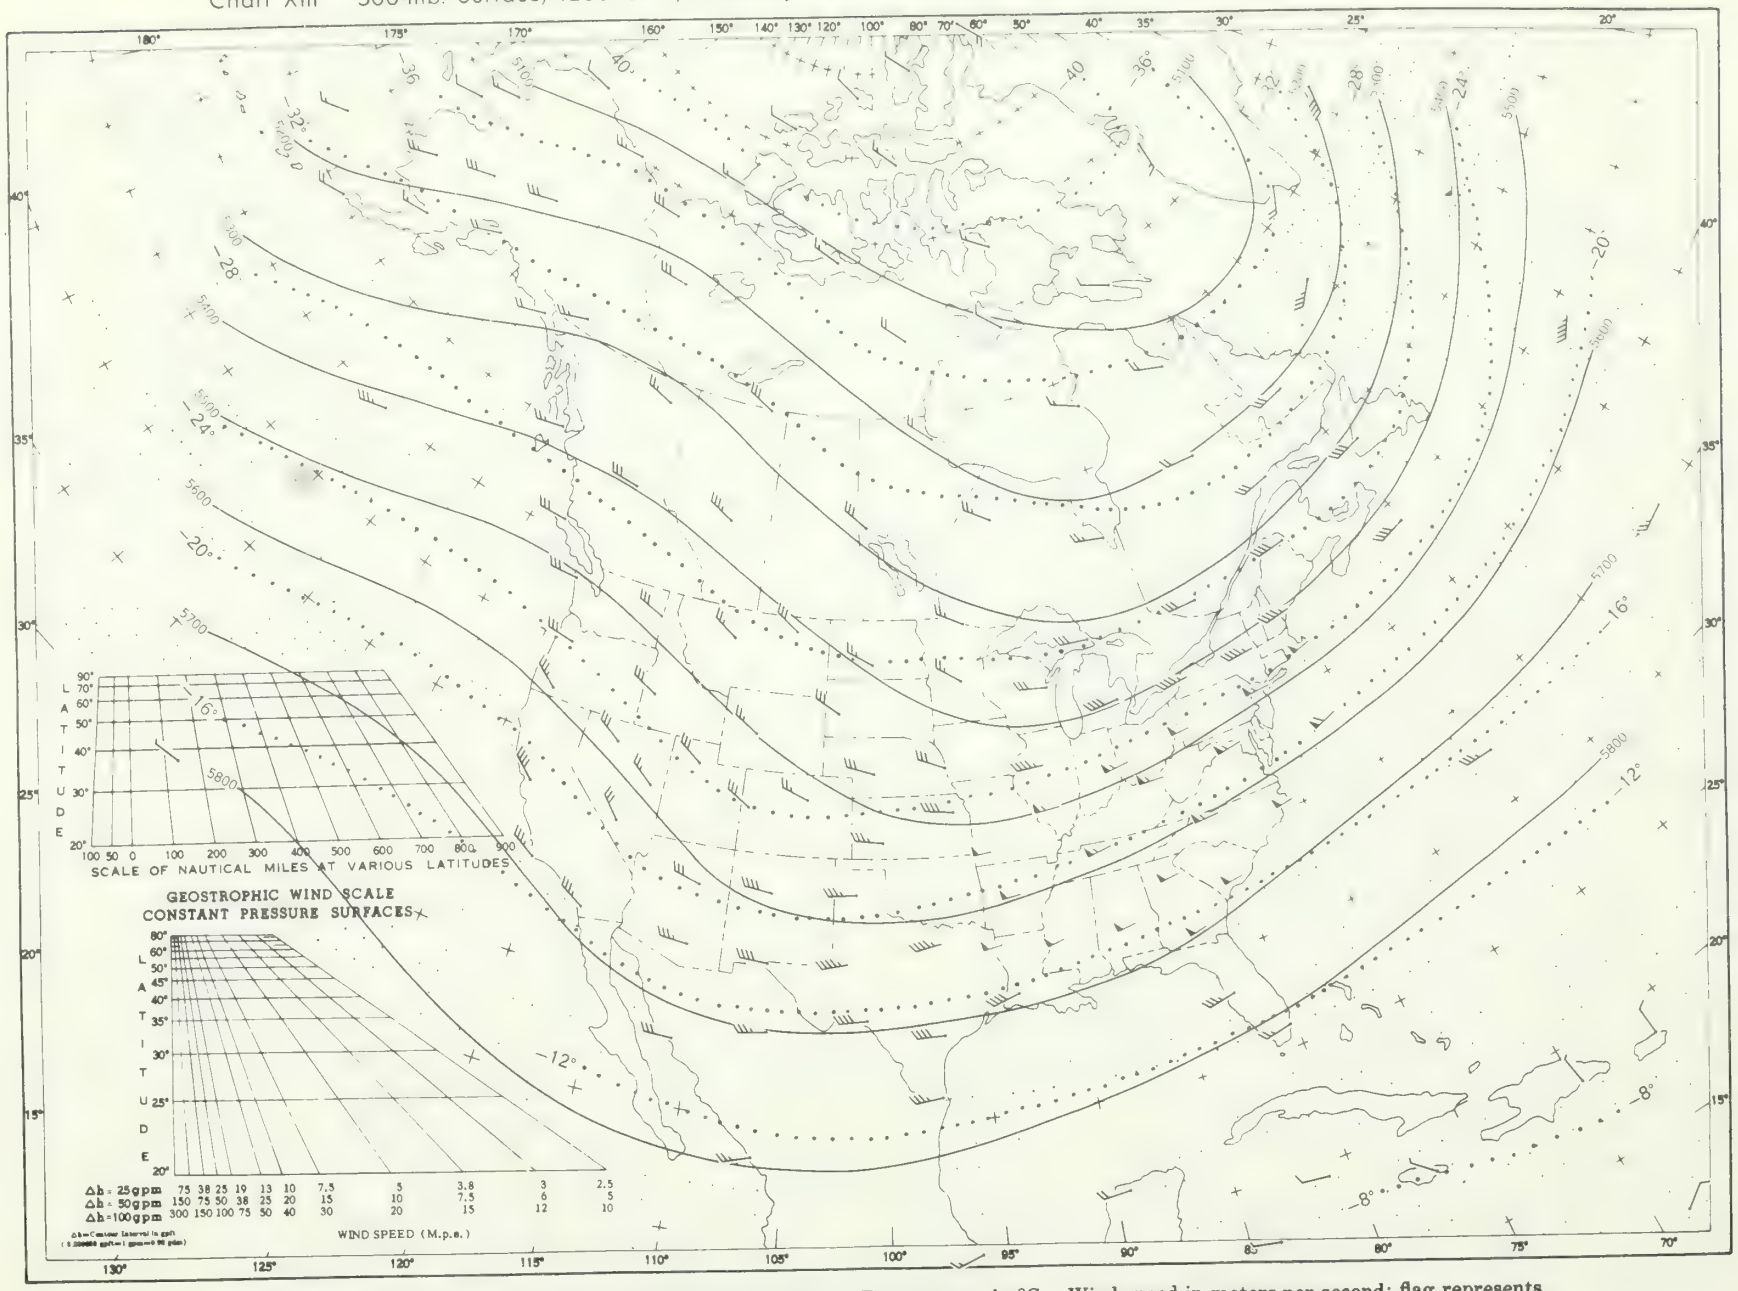
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X Average Sea Level Pressure (mb) and Resultant Surface Wind, **February 1971**. Inset. Departure of Average Pressure (mb) from Normal, **February 1971**.



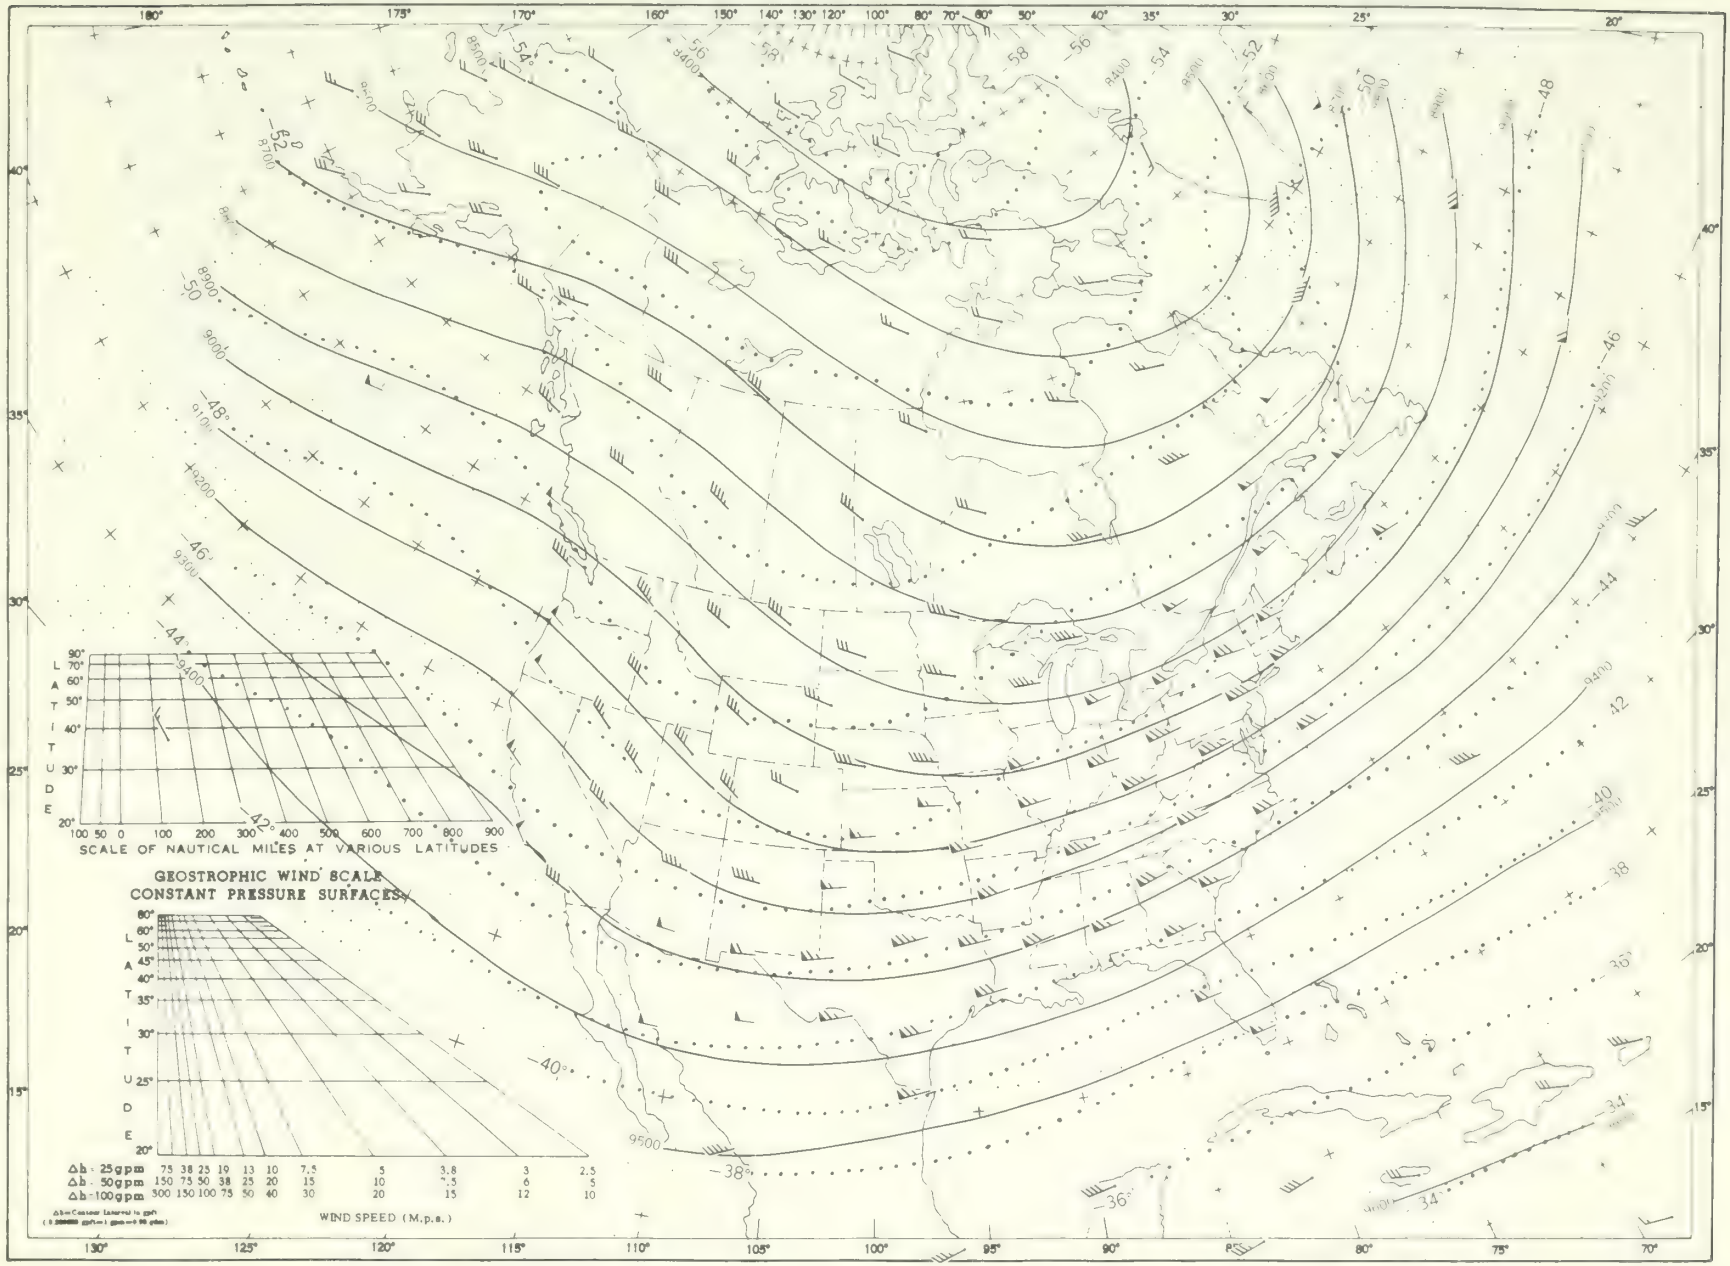
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI 850-mb Surface, 1200 GMT, February 1971. Average Height and Temperature, and Resultant Winds



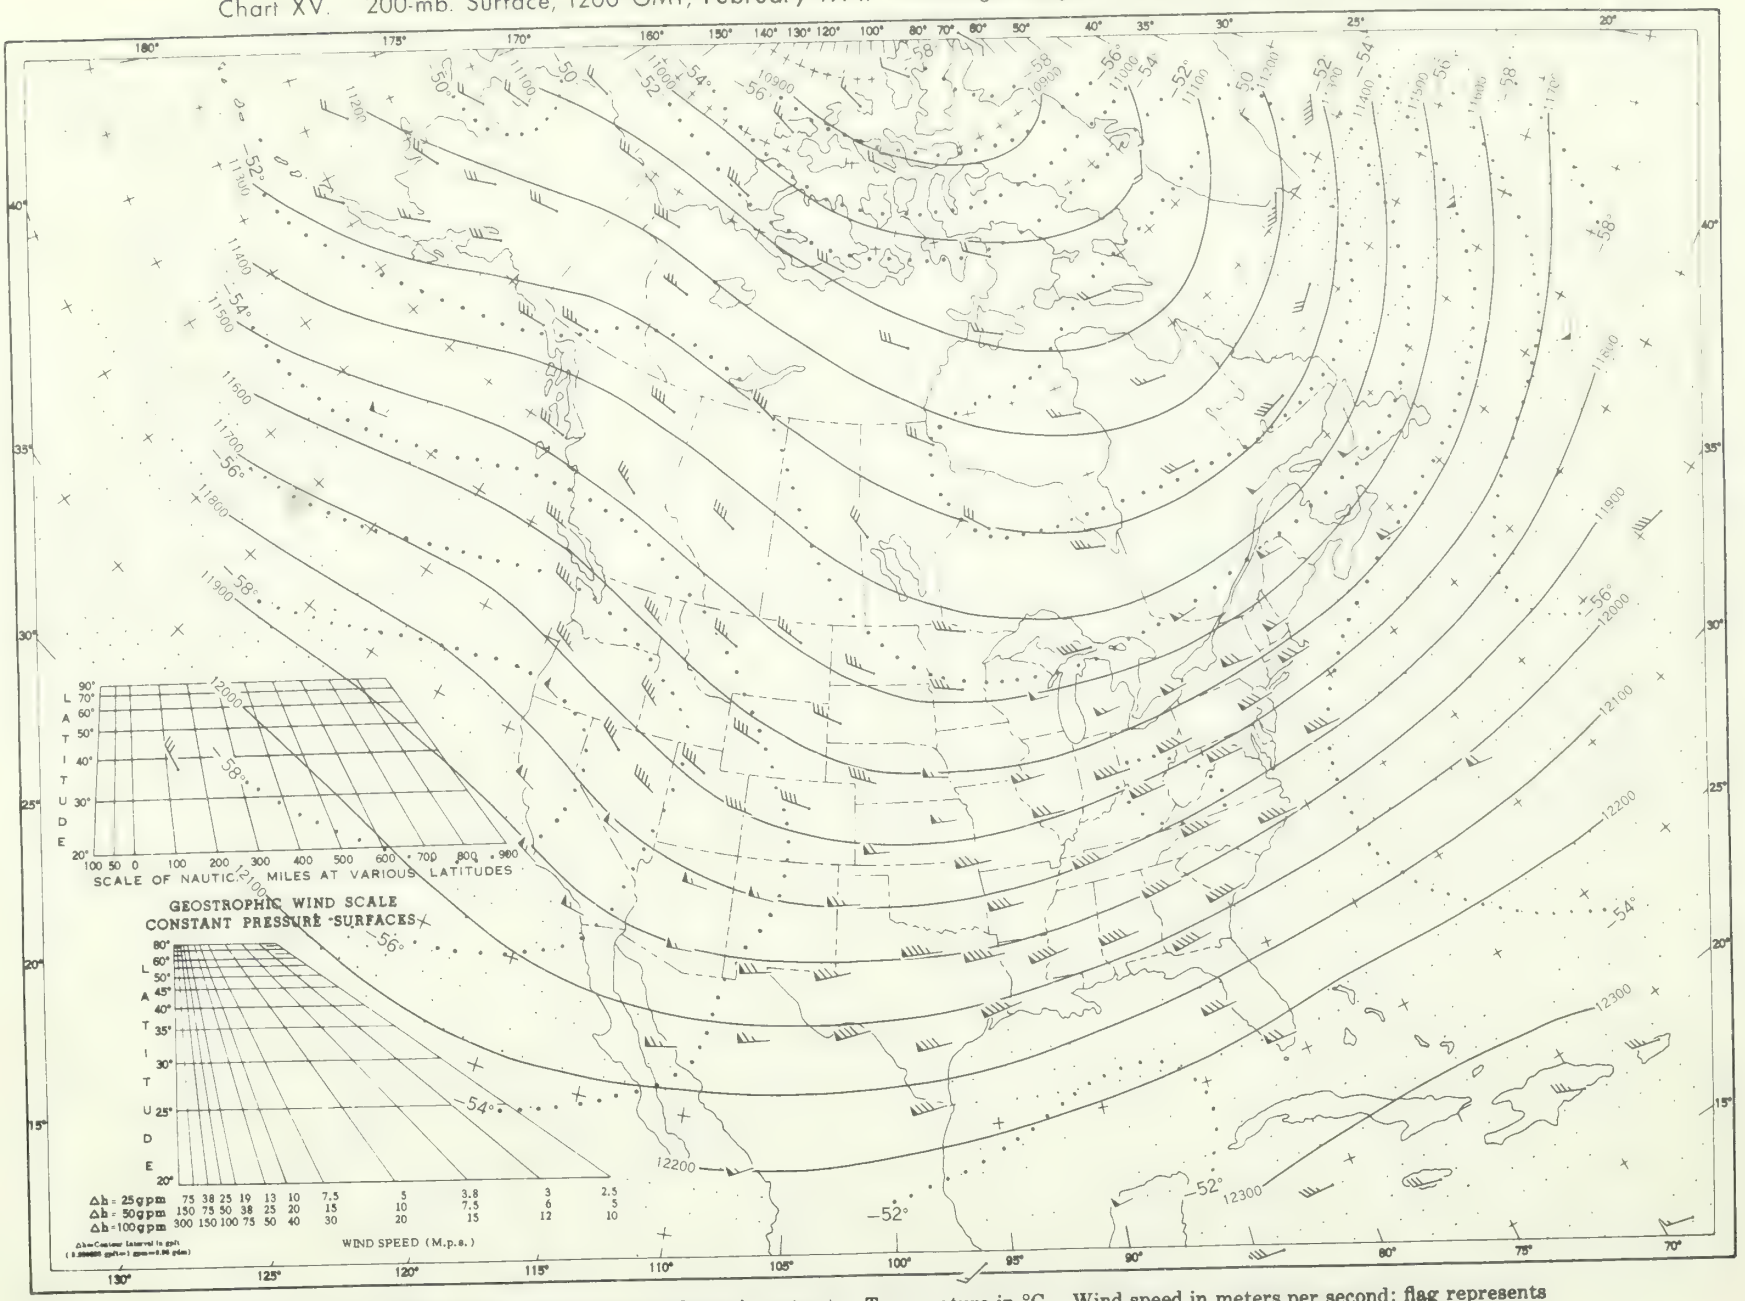
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb Surface, 1200 GMT, **February 1971**. Average Height and Temperature, and Resultant Winds



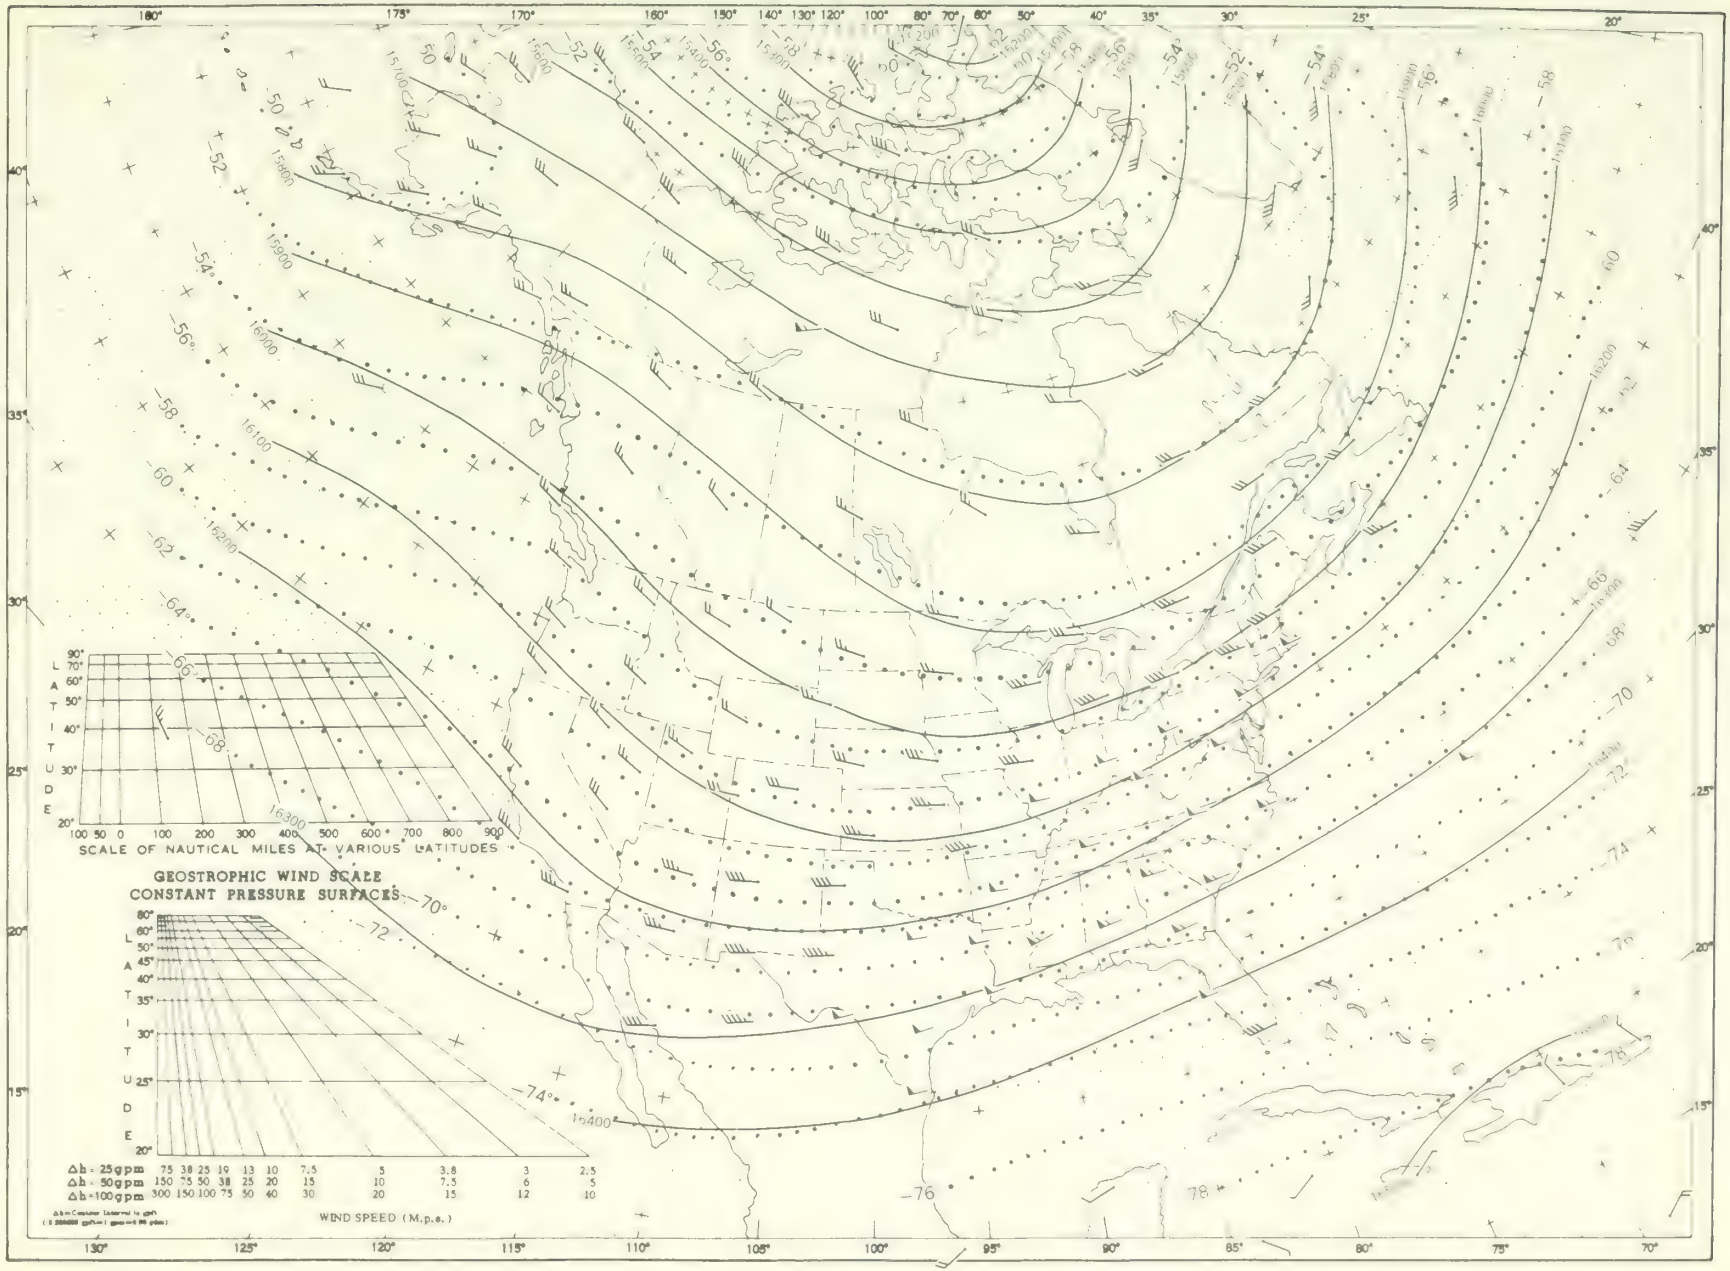
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII 500-mb. Surface, 1200 GMT, **February 1971.** Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV. 300-mb. Surface, 1200 GMT, **February 1971.** Average Height and Temperature, and Resultant Winds

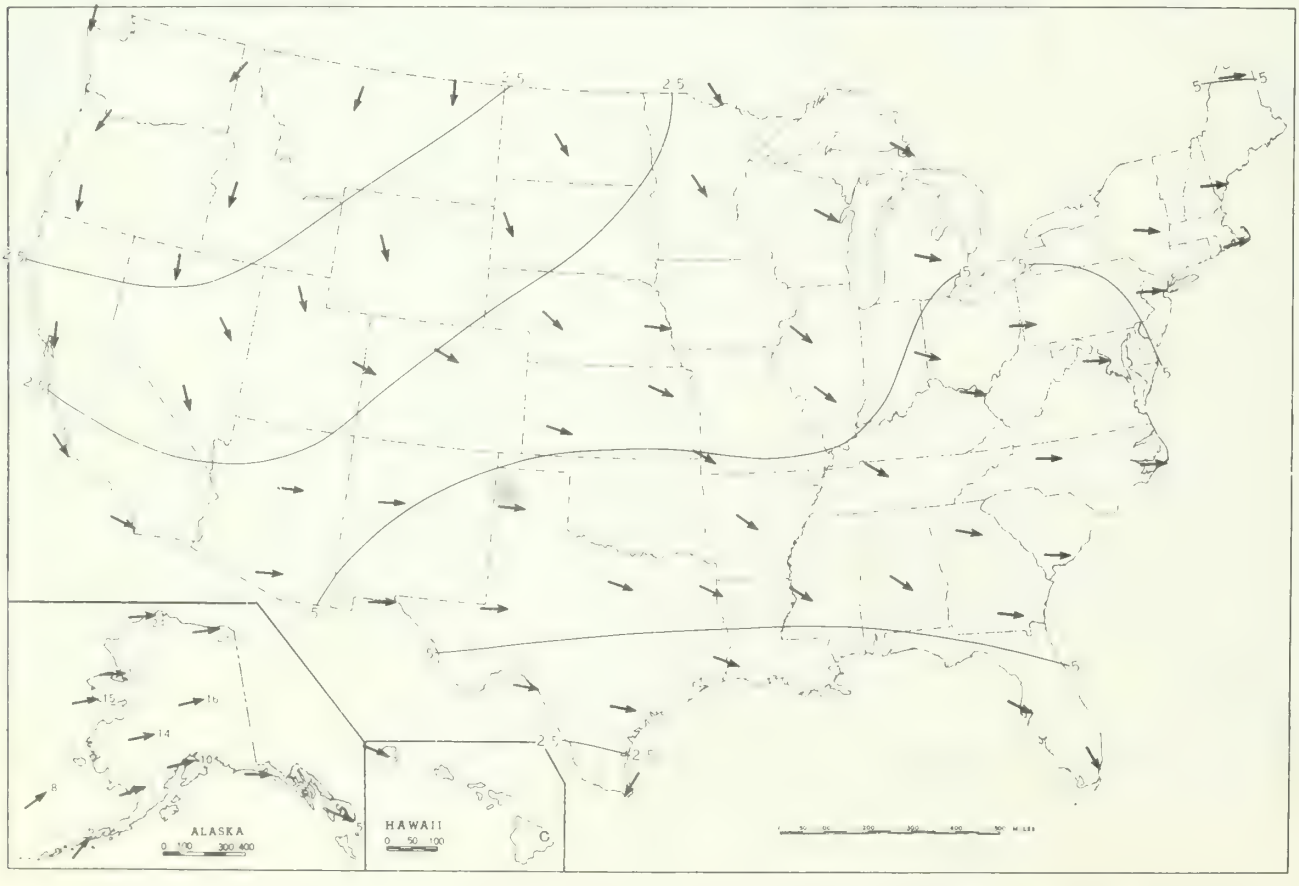


Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV. 200-mb. Surface, 1200 GMT, February 1971. Average Height and Temperature, and Resultant Winds

Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI 100-mb. Surface, 1200 GMT, **February 1971.** Average Height and Temperature, and Resultant Winds.



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 GMT, February 1971. Resultant Winds.

B. 30-mb. Surface, 1200 GMT, February 1971. Resultant Winds.

Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

NATIONAL SUMMARY

Volume 22 No. 3 MARCH 1971

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:
1. March 1971 was a windy month with frequent temperature changes.
2. A variety of stormy weather occurred in March. It included snowstorms, blizzards, thunderstorms, tornadoes, and dust and sandstorms.

TEMPERATURE.--Monthly mean temperatures for March averaged slightly cooler than normal over Washington, Oregon, Idaho, southern Nebraska, central and eastern Kansas, and from the Mississippi River Valley to the Atlantic Ocean and slightly above normal elsewhere.

Cold, windy weather prevailed over most of the Nation in the first week of March. Blustery winds held afternoon temperatures below freezing as far south as the Texas Panhandle and most of Kentucky on 1 or 2 days. Temperatures dropped to below freezing in northern Florida and to zero or lower in the Rocky Mountains as far south as northern New Mexico; also from North Dakota to Wisconsin. On the morning of March 5, Tallahassee, Fla., registered 23°. This is the lowest temperature of record for Tallahassee for the month of March.

Winter temperatures continued from the northern Great Plains to New England early in the 2d week of March. Detroit Lakes, Minn., registered 20° below zero on the morning of March 8. Arctic air poured southward and freezing weather reached the Gulf Coast. New Orleans, La., recorded 28° on March 8. As brisk northerly winds brought cool temperatures southward on the front side of a High, southerly breezes brought a warming trend to mid-America on the back side of the High. By March 11, maximums over the Great Plains ranged from the 40's and 50's in the Dakotas to the 60's in Kansas, the 70's in Oklahoma, and the 80's in much of Texas. Waco and Alice, both in Texas, registered 88° and 89°, respectively on March 11. In the Far West, afternoon temperatures ranged from the 40's in Washington to the 80's in southern California. Subfreezing temperatures occurred almost every morning in the 2d week of March in the Great Basin and the Rocky Mountains.

At midmonth, southerly winds brought warmer weather to mid-America. Gage, Okla., registered 87° on the 13th and temperatures over much of Texas reached the 90's. McAllen, Texas, recorded 101° on the 14th. Meanwhile, a cooling trend was occurring over the West with temperatures tumbling to the freezing mark from Canada to Mexico. Douglas, Ariz., registered 30° on March 15. Mild weather continued along the Atlantic coast. Southerly breezes warmed the Atlantic seaboard and temperatures reached the 70's as far north as New Jersey on March 15. The Florida Peninsula warmed to the 80's. Orlando recorded 88° on the 15th and Palm Beach 89° on the 19th. Southern Texas continued warm. San Antonio recorded 92° on the 16th and Cotulla 93° on the 18th.

A mound of high pressure lay over the East about the middle of the 3d week of March. Temperatures dropped to freezing as far south as northern Florida, reaching 28° at Tallahassee and 32° at Jacksonville on the 18th. Subzero temperatures occurred at some locations in northern Wisconsin and Upper Michigan, -11° at Eagle River and Land O'Lakes, Wis., on the 17th, and -12° at Marquette County Airport, Mich., on the 18th. Mid-America warmed briefly on March 20 when some parts of Kansas were 30° warmer than the previous day. The 21st brought another blast of frigid weather to the northern Great Plains and some areas remained below freezing all day long. Northerly winds pushed the cold air far southward. McComb, Miss., registered 30° on the morning of March 21.

Temperatures in the last week of March averaged much warmer than normal over the Great Basin, the central and southern Rocky Mountains, and the western edge of the central and southern Great Plains. Record-breaking afternoon temperatures occurred on the 28th, reaching 100° or higher at a number of Texas stations. March 29 brought an abrupt temperature change to Texas with afternoon maximums ranging from the upper 60's to the low 80's.

The month ended with a wide range of temperature over the Nation. Northeastern Montana remained below freezing on the last day of March when the Plains of Texas warmed to near 90°.

PRECIPITATION.--March precipitation exceeded the March normals in small areas in the Northwest, northern Wisconsin, Upper Michigan, northern Lower Michigan, northern New England, and from central Mississippi to the Carolina coast. Most of the Great Plains received less than 25% of normal March precipitation. A large area from southern Nevada and Arizona to western Texas received no rain or only light widely scattered sprinkles.

A generous variety of stormy weather occurred in March. Rain fell along the northern Pacific coast with snow in the mountains in the first half and the last week of the month. Dust and sand storms occurred in the southwestern deserts and along the western edge of the central and southern Great Plains. Snowstorms and blizzards whitened the northern and central Great Plains and eastward to New England. Freezing rain and freezing drizzle fell south of the snow belt, and violent thunderstorms, some with hail and a few tornadoes struck the Deep South.

Spots in Mississippi and Alabama received up to 4.00 inches or more on March 2. A storm in the Southeast deepened on the 3d and spread disagreeable weather over the eastern half of the Nation. Tornadoes occurred in South Carolina and the Tampa, Fla., vicinity. Showers fell along the Atlantic coast. A wide band of snow and freezing rain fell from the Ohio River Valley to Maine and southward to northern Alabama and the Carolinas. The storm center deepened. The pressure at Portland, Maine, dropped to 28.44 inches, the lowest pressure in their century of records. Winds gusted to hurricane force, 75 m.p.h. A foot or 2 of snow fell in parts of New York and New England. Portland, Maine, received 11 inches of snow early on the 5th, bringing their seasonal total to 116.5 inches. As the deep storm moved out over the Atlantic Ocean, another storm moved from the southern Great Plains to the Northeast. It brought more violent weather to the eastern half of the Nation, heavy snow, sleet, and freezing rain to the Northeast, severe thunderstorms

and a few tornadoes in the Deep South.

A deep Low in the Gulf of Alaska moved to the northern Pacific coast in the 2d week of March. It brought wet and windy weather to the Northwest. Bright sunny weather prevailed in the South at the beginning of the 2d week of March but a Low developed and clouds and winds increased. Heavy thunderstorms broke out and hail pelted spots in Arkansas and Louisiana. At De Ridder, La., the winds gusted to 100 m.p.h. on the evening of March 9. The inclement weather spread to the middle Mississippi and Ohio Valley regions. Snow fell from Iowa to Indiana late March 9 before spreading northeastward to the already-snowbound New York and New England. By noon, March 10, the seasonal snowfall at Syracuse, N. Y., had reached 141.8 inches, only 5.0 inches less than their alltime record seasonal total. By evening, March 11, Portland, Maine, had received 8.2 inches of new snow bringing their total for the season to 125.6 inches and setting a new seasonal record. The record at Portland began in 1881. The previous record seasonal total was 119.1 inches of snow which fell in the 1933-34 season.

A storm in the intermountain region caused rain along the northern and central Pacific coast on March 12. Moving eastward, it caused snow flurries in the northern Rocky Mountains and the northern Great Plains. The wind at Lander, Wyo., gusted to 84 m.p.h. on the morning of March 16. Duststorms occurred over the Great Plains to New Mexico and western Texas which were becoming very dry. Tornadoes occurred in southern Oklahoma, northeastern Texas and southwestern Arkansas.

About midmonth, gusty winds and a few tornadoes occurred in the Ohio River Valley. Heavy snow fell in the northern Great Plains and the Upper Mississippi River Valley. A new storm developed in the Great Basin late on March 16 and early on the 17th. It spread snow over the central Rocky Mountains as it moved eastward. Three inches of snow fell at Rapid City, S. Dak., accompanied by winds gusting to 50 m.p.h. Much stronger gusts occurred farther south. Grand Junction, Colo., registered gusts to 63 m.p.h. Blowing dust reduced visibility at Grand Junction to 1/2 mile. Widespread duststorms occurred in the Oklahoma and Texas Panhandles and west of the Pecos River in Texas.

The storm deepened as it moved eastward on the 18th. Blowing snow or blowing dust reduced the visibility to near zero in places. The gusts reached 100 m.p.h. at Hastings, Nebr. At Hays, Kans., the winds remained at 65 m.p.h. or higher for 3 consecutive hours, reaching a peak gust of 115 m.p.h. The storm continued its northeastward movement dumping 6 to 15 inches of new snow along its path.

Heavy snow along the middle portion of the Nebraska-Kansas line closed schools on March 24. The snow spread eastward to Kentucky and the Carolinas. Clemson, S. C., was buried in 10.5 inches of snow and 13 inches fell at Blackstone, Va. The storm moved off the Atlantic coast about March 27.

Light rain fell along the northern Pacific coast in the last few days of March. Snow flurries occurred south and east of the Great Lakes, showers fell along the southern Atlantic and Gulf coasts, and sand and dust again filled the air in the western portions of the Great Plains.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified U indicates Urban, R indicates Rural, sites

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1 C or above for Alaskan Stations
Y Peak Gust
+ And also on an earlier date or dates
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication

Data in this table are obtained by conversion from data in the English Units table

Includes crop damage.
C Crop damage.
* No occurrence of storms or unusual weather phenomena reported.
‡ Includes heavy sleet storm.
\# Freezing drizzle and freezing rain, commonly known as glaze.
ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
† Storm damages are placed in categories varying from 1 to 9 as follows:

1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5 Million
7 $5 Million to $50 Million
8 $50 Million to $500 Million
9 $500 Million to $5 Billion.

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS
MARCH 1971

Elmer R. Nelson, Office of Hydrology

Moderate to severe flooding occurred in some areas in the South Atlantic and East Gulf of Mexico Drainages during March. Flooding on the Ocmulgee River at Macon, Ga., was of record proportions. The Oconee River at Milledgeville, Ga., reached its highest level since 1886. Major flooding occurred along the Flint and Apalachicola Rivers in Georgia, the Pee Dee, lower Broad and Congaree Rivers in South Carolina and on the Tallapossa and Alabama Rivers in Alabama. Widespread lowland flooding occurred along the Pearl River in Mississippi and Louisiana.

At Fairbanks, Alaska, water equivalent of snow on the ground on Mar. 24 was reported to be more than 8 inches. At some points in the Chena River Basin, the snowpack was reportedly as much as twice the average for this time of year.

ST. LAWRENCE DRAINAGE

Lake Michigan.--Rapid snowmelt during mid-March caused minor flooding on the Red Cedar River at Williamston, Mich., on the 15-16th. No flooding occurred downstream at East Lansing, Mich.

Ice jams on the Grand River caused fluctuations in the river level in the Comstock Park area at Grand Rapids, Mich., between Feb. 23 and Mar. 4. Most of the damage resulted from ice action. About 40 homes were evacuated due to high water.

Lake Huron.--Minor flooding occurred on the Shiawassee River at Owosso, Mich., on the 15th. No damage resulted.

Lake Erie.--The flooding on the St. Joseph River at Montpelier, Ohio, in the beginning of the month was due to heavy rain on frozen ground on Feb. 19-20. The crest on Feb. 21 was 4.2 ft. above flood stage. The St. Joseph River exceeded flood stage again on Mar. 15-19. The crest on the 17th was 3 ft. lower than the first crest.

Lake Ontario.--Minor flooding occurred on Oatka Creek at Garbutt, N. Y., from Feb. 28 to Mar. 1 and on Mar. 16-17. No damage resulted from the two rises.

Extensive flooding occurred in the lower Black Creek Valley at Churchville, N. Y., on Feb. 27 to Mar. 3 and on Mar. 16-18. No damage resulted from the two rises as the high water occurred over pasture land, or land not in use at this time of the year. State route 258 was flooded for more than one week and route 63 was flooded with 2/3 foot of water on the night of Mar. 15.

ATLANTIC SLOPE DRAINAGE

Warm temperatures and snowmelt with substantial rainfall resulted in some minor rural lowland flooding in the Wallkill Basin and on Wappinger Creek in eastern New York. An ice jam on the Wallkill near New Paltz, N. Y., caused some lowland flooding for about one week, affecting several homes and one highway.

Minor flooding occurred on the Chemung and Susquehanna River in New York on the 16-17th. Crests on the Chemung River ranged from 2 to 4 ft. above flood stage on the 16th. No damage, however, was reported.

All 13 major water supply reservoirs in New Jersey were filled to 100% capacity by the end of March, with most of them overflowing. The pumped storage reservoir at Round Valley was filled to 92% capacity, the highest storage yet recorded. New York City's three reservoirs on the upper Delaware increased storage by 50.5 billion gallons during March and are now at 86% of usable capacity with Cannonsville already filled to capacity and spilling from the 21st to the end of the month. Lake Wallenpaupack increased storage by 9.4 billion gallons and is now at 72% of usable capacity.

The lower Neuse River at Kinston, N. C., was slightly above flood stage in the beginning of the month from the widespread precipitation during the closing days of February. Heavy rain during the 48 hour period ending at 7 a.m. on the 4th caused general flooding along the Neuse and Cape Fear Rivers and local flooding on the Roanoke and Tar Rivers. The precipitation totaled 2 to 4 inches over most of the Cape Fear, Tar and Neuse Basins and 1 to 2 inches over the Roanoke. Portions of the lower Cape Fear River rose some 15 ft. over its banks and the lower Neuse up to 6 ft. above bankfull.

The highest flooding since Oct. 1964 occurred along the Rocky River at Norwood, N. C. The crest on the 3d was over 10 ft. above flood stage. The highest flooding in a number of years occurred on the Lynches River at Effingham, N. C., on the 3d-12th. The Lumber River at Lumberton, N. C., has continued in flood from Jan. 30 and was still in flood at the end of March. The highest crest occurred on Mar. 5 when it reached a stage of 14.4 ft., 5.4 ft. above flood stage. The flooding along the lower Waccamaw River from the 14th through the 22d made closing of the railroad drawbridge at Conway, S. C., necessary for 5 or 6 days. Lowland and swampland were the principal areas affected along the Black River. The crest of 15.2 ft. at Kingstree, S. C., lacked less than 1 foot of equalling the 1945 flood level. Flooding occurred on the Little Pee Dee River almost all month and was the highest since 1964. Major flooding occurred along the Pee Dee River from below Blewett Lake, N. C., downstream to Cheraw and Peedee, S. C., to the coast. The rapid rise of over 18 ft. within 24 hrs. at Cheraw, S. C., gave little time for protective measures. The crest of 38.3 ft. (flood stage 30 ft.) at Cheraw equalled the August 1970 flood. At Peedee, S. C., the crest of 24.0 ft. was the highest since Oct. 1964. Flooding occurred along the Saluda River from below Lake Greenwood to the upper end of Lake Murray on the 2d-5th. Major flooding occurred along the lower Broad River from Blair, S. C., to Columbia, S. C., and along the Congaree River below Columbia, S. C., from the 3d through the 7th. A rapid rise occurred in Wateree Lake level on the 3d with a crest 2.3 ft. above full lake on the 5th. The North Fork Edisto at Orangeburg, S. C., and the Edisto River at Givhans, S. C., rose 3.5 to 4 ft. above flood stage between the 3d and 19th. Flooding began again on the North Fork and Edisto on the 28-29th and continued the rest of the month. The total damages from the flooding were estimated at $348,100.

Moderate to heavy flooding occurred on the Savannah and Ogeechee Rivers in Georgia during March. Butler Creek near Augusta, Ga., and the Savannah River reached their highest stages since April 1964. The Ogeechee River at Midville, Ga., crested at its highest stage (9.1 ft.) since March 1944. Light to moderate damage resulted from the overflows.

Record flooding occurred on the Ocmulgee River at Macon, Ga., on the 3d-7th. The crest of 28.95 on the 4th exceeded the previous record stage of 28.0 reported on Nov. 29, 1948 by nearly 1 foot. No major damage resulted from the record high stage. Three or four homes along the river were evacuated. The Geological Survey lost their river gaging equipment at Macon which was valued at about $1,000. Some sand-bagging of low areas at Hawkinsville, Ga., prevented major damage. The Oconee River at Milledgeville, Ga., reached

its highest level (40.2 ft.) since 1886. This was prior to gage records when a stage of 46.6 ft. was recorded from a high water mark. The crest of 40.2 ft. exceeded the previous highest stage of 38.7 ft. recorded in Aug. 1928 by 1.5 ft. The only area of damages occurred in Jones County where the State Highway Commission reported several culverts and dirt roads under construction were washed out. The record to near record flooding was due to 5 to 6 inches of rain during the first 3 days of March.

EAST GULF OF MEXICO DRAINAGE

Heavy and prolonged rainfall during the first week of the month caused flash floods along some small streams in Georgia and major flooding along the Apalachicola, Flint and Chattahoochee Rivers. Another period of heavy rain on the 25-26th caused sharp rises on main streams and minor flooding on the Apalachicola and Flint Rivers. Crest stages on the Flint River during the first 2 weeks of March ranged from about 11 ft. above flood level in the Albany, Ga., area to near 5 ft. above flood level upstream from Crisp County Dam and 3 ft. above flood stage in the lower portion of the river near the pool of Jim Woodruff Dam. On the Chattahoochee River, flooding occurred during the first week of March downstream from West Point, Ga. The crest of the flood ranged from 2.5 ft. above flood stage at West Point to about 8.5 ft. above the flood level in the lower portion of the river. Except for two days (Mar. 23-24) the Apalachicola River at Blountstown, Fla., was above flood stage the entire month.

The most extensive flooding since 1964 occurred in Alabama during March. Major floods occurred on the Alabama and Tallapoosa Rivers with all points exceeding flood stage by several feet. The lower Choctawhatchee River at Caryville, Fla., rose above flood stage on two occasions. Minor flooding occurred on the upper Cahaba River early in the month. The most severe flooding occurred on the Tallapoosa and Alabama Rivers with extensive overflow of pastures and woodlands but very little in urban areas. About 25 families were evacuated in the Montgomery area. The total damages were estimated by the Corps of Engineers at $939,500.

Widespread lowland flooding continued during March along the Pearl River from Edinburg, Miss., downstream to Pearl River, La., from the latter part of February. Lowland flooding in the Jackson, Miss., area was limited due to the levee system around the city. Levees were patroled by Civil Defense Units and minor boils in the levee were contained by the Corps of Engineers. Low-lying farm and timber lands adjacent to the river south of Jackson to Pearl River, La., were inundated most of the month. Farming and timber cutting operations were halted in these areas. Lowland flooding on the Chickasawhay, Leaf and Pascagoula Rivers was brief and of little consequence. Flooding along the lower Pearl and at Jackson, Miss., continued into April. Rainfall amounts over Mississippi during March were heavy and ranged from 3.5 inches over the northwest to almost 14.5 inches in the southeast. Rainfall amounts were evenly distributed throughout the month with precipitation occurring every three days. The heavier amounts (1 to 3 inches) occurred on the 1st and around the 18th of the month.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--There was an unusually heavy snow cover over the Upper Mississippi Basin in Minnesota and Wisconsin in the beginning of March. The blizzard that swept across Minnesota on Feb. 26-27 deposited up to 19 inches of snow. This added to the snowpack an amount of precipitation equalling or exceeding that normally expected during the entire month of March. Precipitation during March was below to much below normal except near normal over the upper portion of the St. Croix and Chippewa Basins. Departures were as much as 0.5 to 0.75 inch below long-term means. Most of the precipitation fell as snow during the 10-day period Mar. 10-20. March temperatures were near the long-term mean.

During the last half of March daytime temperatures were frequently above freezing dropping to below freezing at night. As a result, runoff came in a series of pulses rather than in a single rapid melt. This favorable temperature regime helped to keep crests lower than had the snowmelt occurred rapidly.

The Minnesota River crested at Mankato, Minn., on Mar. 19, at a stage of 17.0 ft., 2 ft. below flood stage. Crests in the Jordan to Savage, Minn., reach on Mar. 23-27 were up to 5.2 ft. above flood stage. Tributaries crested about the same time. Quite frequently the Mankato crest coincides with that of the Mississippi River at St. Paul. This spring the crest of the Minnesota River was about 3 weeks ahead of the Mississippi River crest and as a result the crest at St. Paul was reduced considerably.

The Pecatonica and Rock Rivers in northern Illinois which had crested in late February receded to below flood stage during the first week in March. Rains of 1/2 to 1 inch and warm temperatures melted the remainder of the snow causing the tributaries to rise to near bankfull stage around the middle of the month.

The flooding along streams in Iowa in the beginning of the month was due to heavy precipitation on Feb. 17-18 and snowmelt runoff. Considerable ice action along these rivers during the high water caused the water level to fluctuate considerably as the ice jams formed and broke up. Flooding was generally restricted to low-lying farm lands. No significant rain fell on the snowpack during March. This coupled with alternating freeze-thaw cycles allowed melting of the snow with a minimum of flooding. A sharp warming trend on Mar. 10-14 resulted in sudden snowmelt which caused minor flooding of the Des Moines, Iowa, Raccoon, Skunk and East Fork of the Des Moines River and Black Hawk Creek. The greatest flooding was in the middle reaches of the Skunk and Iowa Rivers where it was 3 ft. out of banks. The snowmelt was halted on Mar. 15 as temperatures turned much colder. Crests moved downstream resulting in flooding of only low-lying farm lands.

The minor to moderate flooding in central Illinois in the beginning of the month was due to moderate to heavy rains (1 to 2 inches) on Feb. 21-22. The Big Muddy River at Murphysboro, Ill., which crested nearly 10 feet above flood stage on Feb. 27 receded within its banks on Mar. 8.

Minor flooding occurred early in the month along the Mississippi River from Hannibal, Mo., downstream to Grafton, Ill. Overflows ranged from near bankfull at Winfield, Mo., and Grafton, Ill., to 1.5 ft. above flood stage at Hannibal. This flooding was due to precipitation which occurred upstream late in February.

Missouri Basin.--Minor flooding occurred during March in the Missouri Basin along the Cannonball River at Breien, N. Dak., and west of Mandan on the Heart River. Minor flooding occurred farther west on the Heart River at the junction of Highway 31 where it crosses the Heart River below its confluence with Big Muddy Creek. Favorable fluctuations in temperature

and generally light precipitation decreased the intensity of the flooding from the heavier than normal snowfall during the winter of 1970-71. No significant damage to property or injuries resulted from the minor flooding.

Ice jams on the lower Bad River in South Dakota caused the river to rise 1.4 ft. above bankfull stage on the 14th. There was no actual overflow as the ice jams occurred just below the gage. The lower river banks which overflow at 16 ft. are farther downstream. Ice jams caused the White River at Oacoma, S. Dak., to rise 2.4 ft. above flood stage between the 12th and 15th. Only lowland flooding resulted.

The flooding on Bazile Creek at Niobrara, Nebr., in the beginning of the month was due to runoff from snowmelt and ice jams during the latter half of February. Ice jams early in March caused Bazile Creek to rise above bankfull stage on the 4-7th. The 16.15 foot crest on the 5th was more than 4 ft. lower than the record crest of 20.4 ft. on Feb. 19.

Minor flooding occurred on the James River at Scotland, S. Dak., on the 16-17th. The river at Mitchell, S. Dak., rose to a foot below bankfull level on the 18th and 1/2 bankfull at Huron, S. Dak., on the 16th.

An ice jam on the Sioux River near Brookings, S. Dak., caused the river to rise 5 1/2 ft. over flood stage between the 13th and 19th. The flooding was local, inundating only about 50 acres.

Snowmelt caused the Little Sioux River in western Iowa to rise 1 to 3 ft. above flood stage in the upper reaches and near and below flood stage downstream from Cherokee, Iowa. Most of the high water covered lowland farm areas. Property damage was very light.

Ice breakup and runoff from snowmelt occurred in the Big Blue Basin of southern Nebraska during the middle of the month. Light to moderate overflows developed along the Big Blue River and its tributaries above Beatrice, Nebr. In general only the lower lowlands were inundated. Damage was confined mainly to fences, roads and bridges.

Minor flooding occurred on the Little Osage River at Schell City, Mo., from Feb. 26 to Mar. 3.

Local flooding occurred along the Missouri River at Nebraska City, Nebr., on the 14-15th and at St. Joseph, Mo., on the 14-16th. The flooding was very light and no damages were reported.

Ohio Basin.--The flooding in the Ohio Basin during March was mostly a continuation of the flooding that began during the last 10 days of February. Most of the streams crested during February except for the main stem of the Ohio in the reach at and below Mt. Vernon, Ind. This flooding was due to heavy rainfall (2.5 inches) over the basin above Addison, Ky., (Dam 45) and 1 to 2 inches over the lower basin on Feb. 21-23. These rains caused considerable flooding in the lower portion. Flood damage was generally confined to farm lands and roads and was estimated at nearly $3 million during February and March.

White Basin.--Flooding continued along the Cache River at Patterson, Ark., from Feb. 14 to Mar. 24. The crest on Mar. 1 was 1.6 ft. above flood stage. The flooding was due to heavy rain on Feb. 12-13 and Feb. 21-22. No damage resulted from the flooding.

Lower Mississippi Basin.--The flooding on the St. Francis River at St. Francis, Ark., on Feb. 22 to Mar. 4 was due to heavy rains (2 inches) on Feb. 21. The crest on Feb. 23 was 1.5 ft. above flood stage.

Lowland flooding continued along the Big Black River at Bovina, Miss., from Feb. 26 to Mar. 24 and again from Mar. 25 to Mar. 31. The first rise was due to heavy rains on Feb. 23. Precipitation was evenly distributed throughout March with precipitation occurring every 3 days. Heavier amounts fell on the first and again on the 18th of March. One to 3 inches of rain fell in each period. The first crest on Mar. 4 was 10.3 ft. above flood stage and the second crest on Mar. 25 was 1.7 ft. above flood stage.

The Lower Mississippi River at New Madrid and Caruthersville, Mo., rose above flood stage on Feb. 25 and receded within its banks on Mar. 12-14. The crests observed on Mar. 6-7 were the highest since May 1970.

WEST GULF OF MEXICO DRAINAGE

The only flooding in the West Gulf of Mexico Drainage during March occurred on the Calcasieu River at Hineston, La. The first rise occurred on Mar. 1-8 and the second on Mar. 22-25. The flooding was minor and no damage was reported.

PACIFIC SLOPE DRAINAGE

Central Coastal Basins.--Minor flooding occurred on the Van Duzen and Eel Rivers in northern California on Mar. 26. This was the first flooding on the Eel River during the month of March since 1949. The only record of the Eel River reaching flood stage in March prior to that year was in 1940. Approximately 2,200 acres were inundated in the Eel River delta and Starvation Flats area on the Van Duzen River. However, this same acreage had not been restored from the previous high water in January. This flooding was due to rainfall that averaged 6 inches on Mar. 22-25. Over one half of this amount (3.4 inches) occurred on Mar. 25.

Heavy rain (2 to 4 inches) on the 11-13th caused minor flooding on the South Fork Coquille River at Myrtle Point, Oreg., on the 12th. No damage resulted from this rise.

Columbia Basin.--An intense storm moved into the middle and upper Snake River Basin late on the 25th and 26th. Rains of 0.5 to 0.75 inch brought a surge to streams along the Weiser River. The Weiser River rose to a crest of 8.5 ft., 0.5 ft. above flood stage, on the 26th. The flood waters receded below flood stage on the 28th. No property damage was reported. During this same period, the Owyhee and Portneuf Rivers showed a marked increase in flow. No flooding occurred from the Portneuf, although water was reported over the bank in the vicinity of Inkom and McCammon, Idaho. The only high water on the Owyhee River was from the large discharge released from the reservoir causing high water along the channel from the damsite to its confluence with the Snake River above Nyssa, Oreg. High water also occurred in Willow Creek on the outskirts of Idaho Falls, Idaho, on Mar. 25 & 26. Some localized flooding occurred.

Late on the 9th, the first of a warmer storm series began bringing 2-inch precipitation amounts to coastal areas (northern Oregon beaches) and daily one-inch amounts to Coast Range Willamette Valley locations. This lasted through the morning of the 12th. The 3-day storm total was about 6 inches at northern coastal stations and near 3 inches at Coast Range locations. All Coast Range Willamette tributaries responded with substantial rises. The Marys River near Philomath, Oreg., crested 0.3 ft. below flood stage on the 12th. The Luckiamute River near Suver, Oreg., crested just under flood stage (27 ft.) on the 12th near 26.9 ft. The Nehalem River near Foss, Oreg., had an initial crest on the 11th, very close to the 13 foot flood stage and then reached a secondary and higher crest of near 16 ft., on the 12th. The South Yamhill River near

Whiteson, Oreg., rose steadily to slightly above bankfull stage by mid-afternoon on the 11th, leveled off for several hours and then rose rapidly to a crest near 41.8 ft. about 9 p.m. on the 12th. The more sluggish basins (the Pudding and Tualatin) responded with gradual rises which eventually resulted in crests of 21.0 ft. at Aurora, Oreg., and 32.3 ft. at Farmington, Oreg., on the 14th, 1.0 and 3.3 ft. above their respective flood stages. Minor rises were noted on the main stem of the Willamette during this period. The Corps of Engineers estimated the damage from overbank flows at $276,000.

Northern Coastal Basin.--Minor overflow occurred along the Chehalis River at Centralia, Wash., on the 12-13th. The river crested 1.3 ft. above flood stage on the 13th. This overflow was due to heavy rains totalling about 5 inches in 2 days in the Willapa Hills, but less elsewhere in the basin. Damage was minor.

FLOOD STAGE DATA

All dates in 1951 unless otherwise indicated. Apr. 1951

River and station	Flood stage	Above flood stages -dates From-	To-	Crest * Stage	Date

[illegible] Greenwich. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G.c.t.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun. MARCH 1971

* Values corresponding to true solar noon
H Haze

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1967 issue, Vol. 8, No. 2, page 64 of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

March 1961

Note. --Langley is the unit used to denote one gram calorie per square centimeter.
Values with an asterisk are interpolated.

U Indicates Urban sites.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys. MARCH 1971

Note.--Langley is the unit used to denote one gram calorie per square centimeter.

Values with an asterisk are interpolated.

The solar radiation data in this table form the basis for the analyses in Parts VII, A, and B, of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

NET RADIATION

Net radiation in langleys per day (0.3 - 3.0 μ) AT PALMER, ALASKA.

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	-.7	-37	-47	-1	-83	-104	-28	-26	-41	-5	-21	-41	-54	-67	-41	-24	-13	-2	-29	-11	-1	-9	-41	-39	-2	-44	-	-	-	-66	-1	-.4

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature that are published as received from the Palmer [illegible] Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

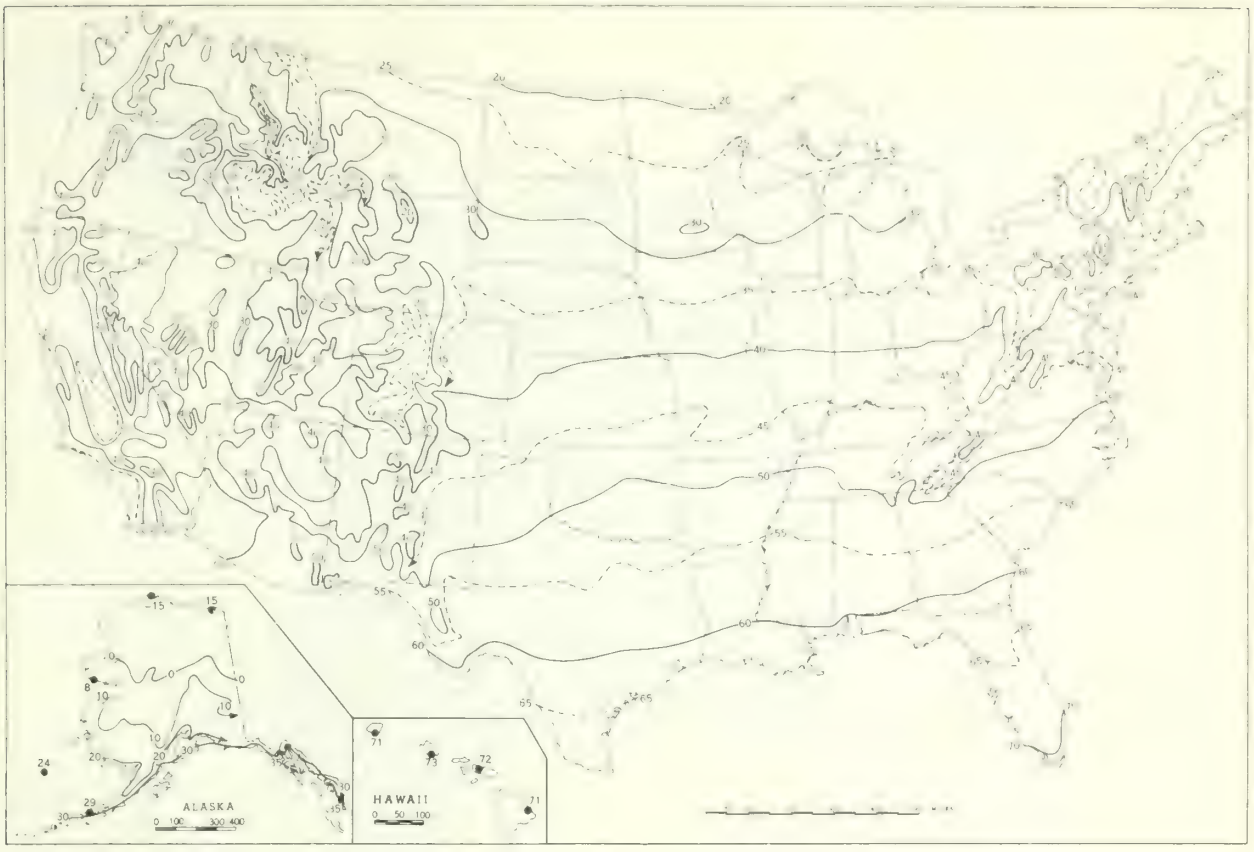
SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (.3900 A) at Ames, Iowa.

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg
Langleys. . .	12.53	13.02	13.81	12.38	3.94	15.71	16.77	16.97	10.95	14.01	6.11	11.09	10.16	3.81	6.21	11.25	14.11	1.38	17.56	16.48	7.89	12.83	14.21	11.91	10.20	4.81	13.71	18.16	11.[illegible]	13.84	12.[illegible]	

These data are from an E - V Ippley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA



These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code [illegible] defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units Milli-atmo-cms.

The spectrophotometer measures the total amount of ozone in the atmosphere, i.e. the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column is usually expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g. 45 milli-atmo-cms ozone implies an ozone layer 0.3 centimeter thick. The code [illegible] is designates the type of measurement made.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), March

B. Temperature Departure from 30 - Year Mean (°F 1931-60), March 1971.

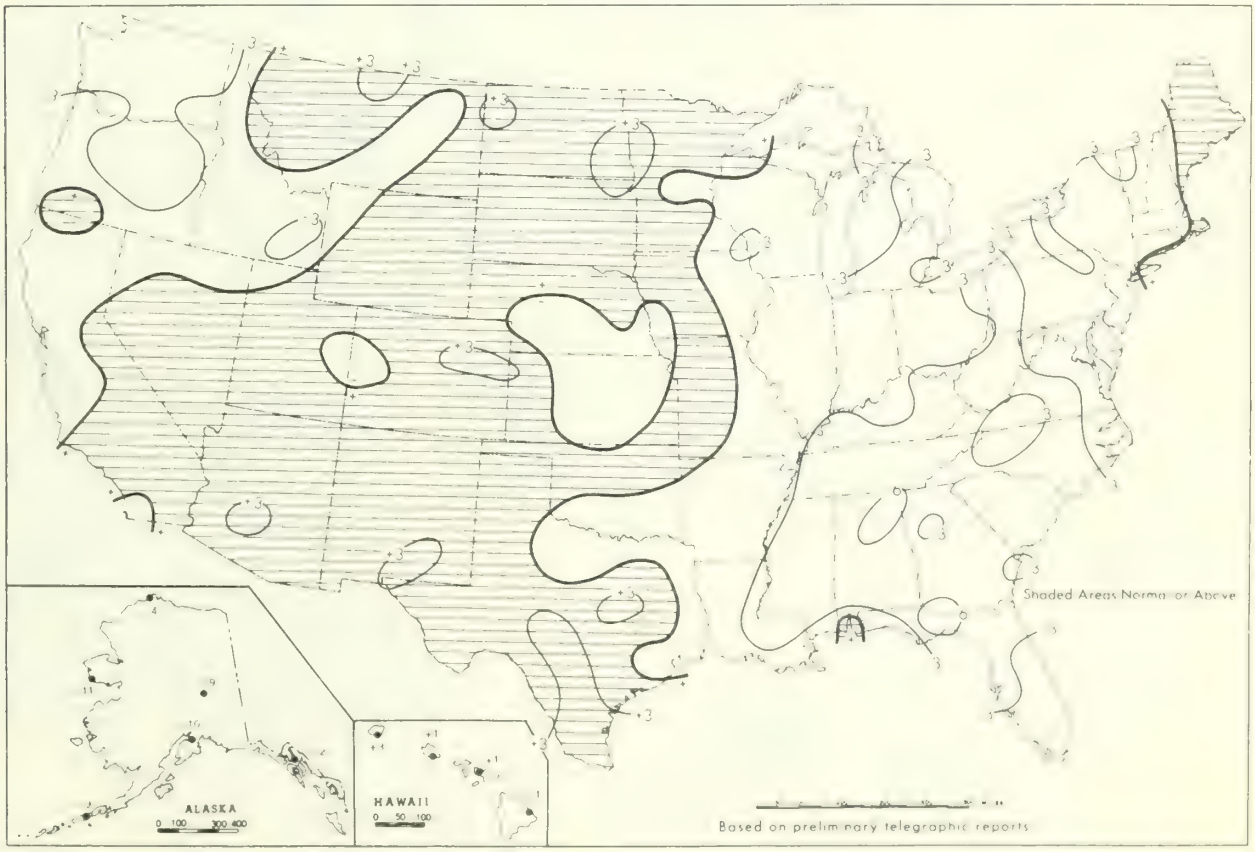

Chart II Total Precipitation (Inches), March 1971.

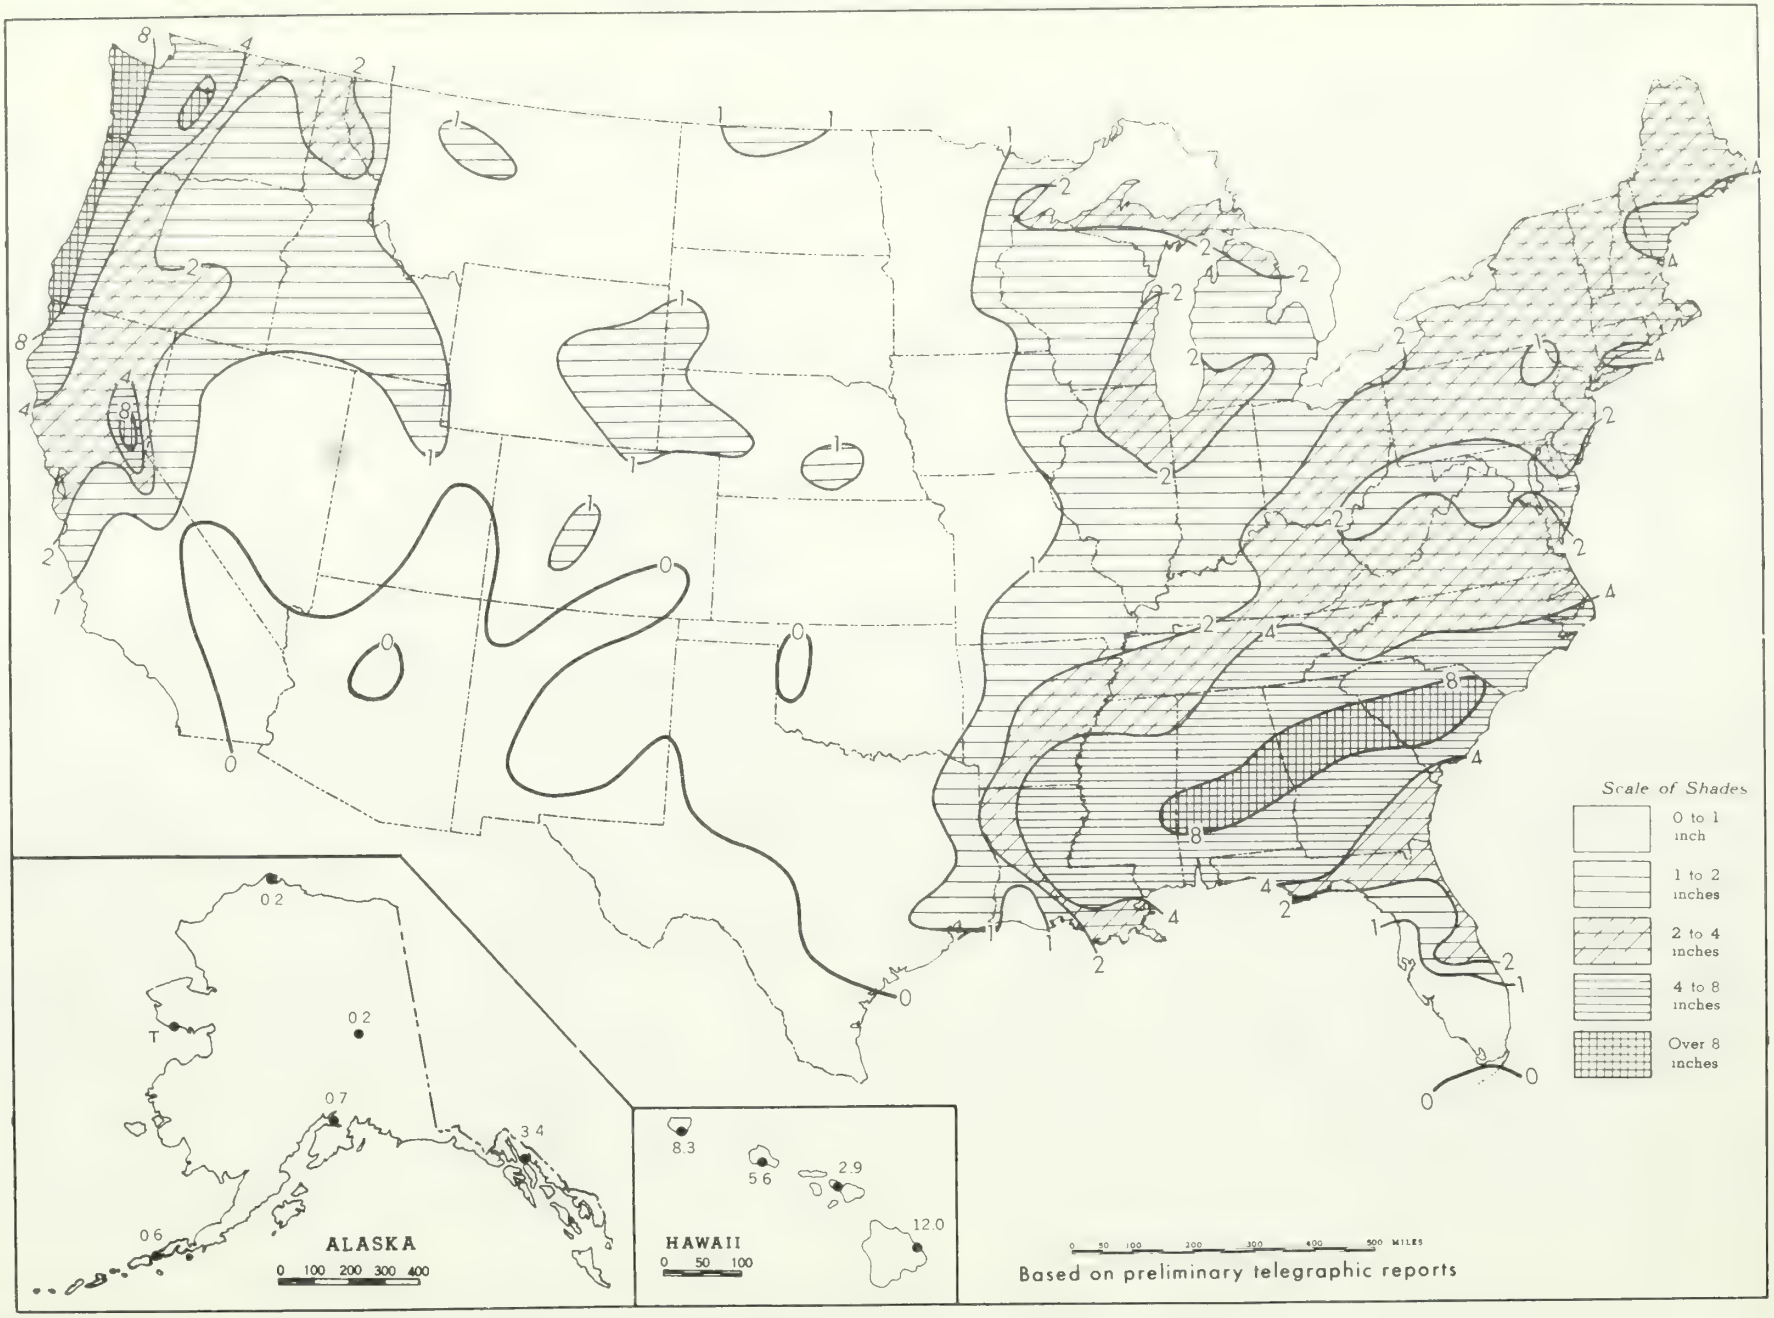

Chart III. Percentage of Normal Precipitation, March 1971.

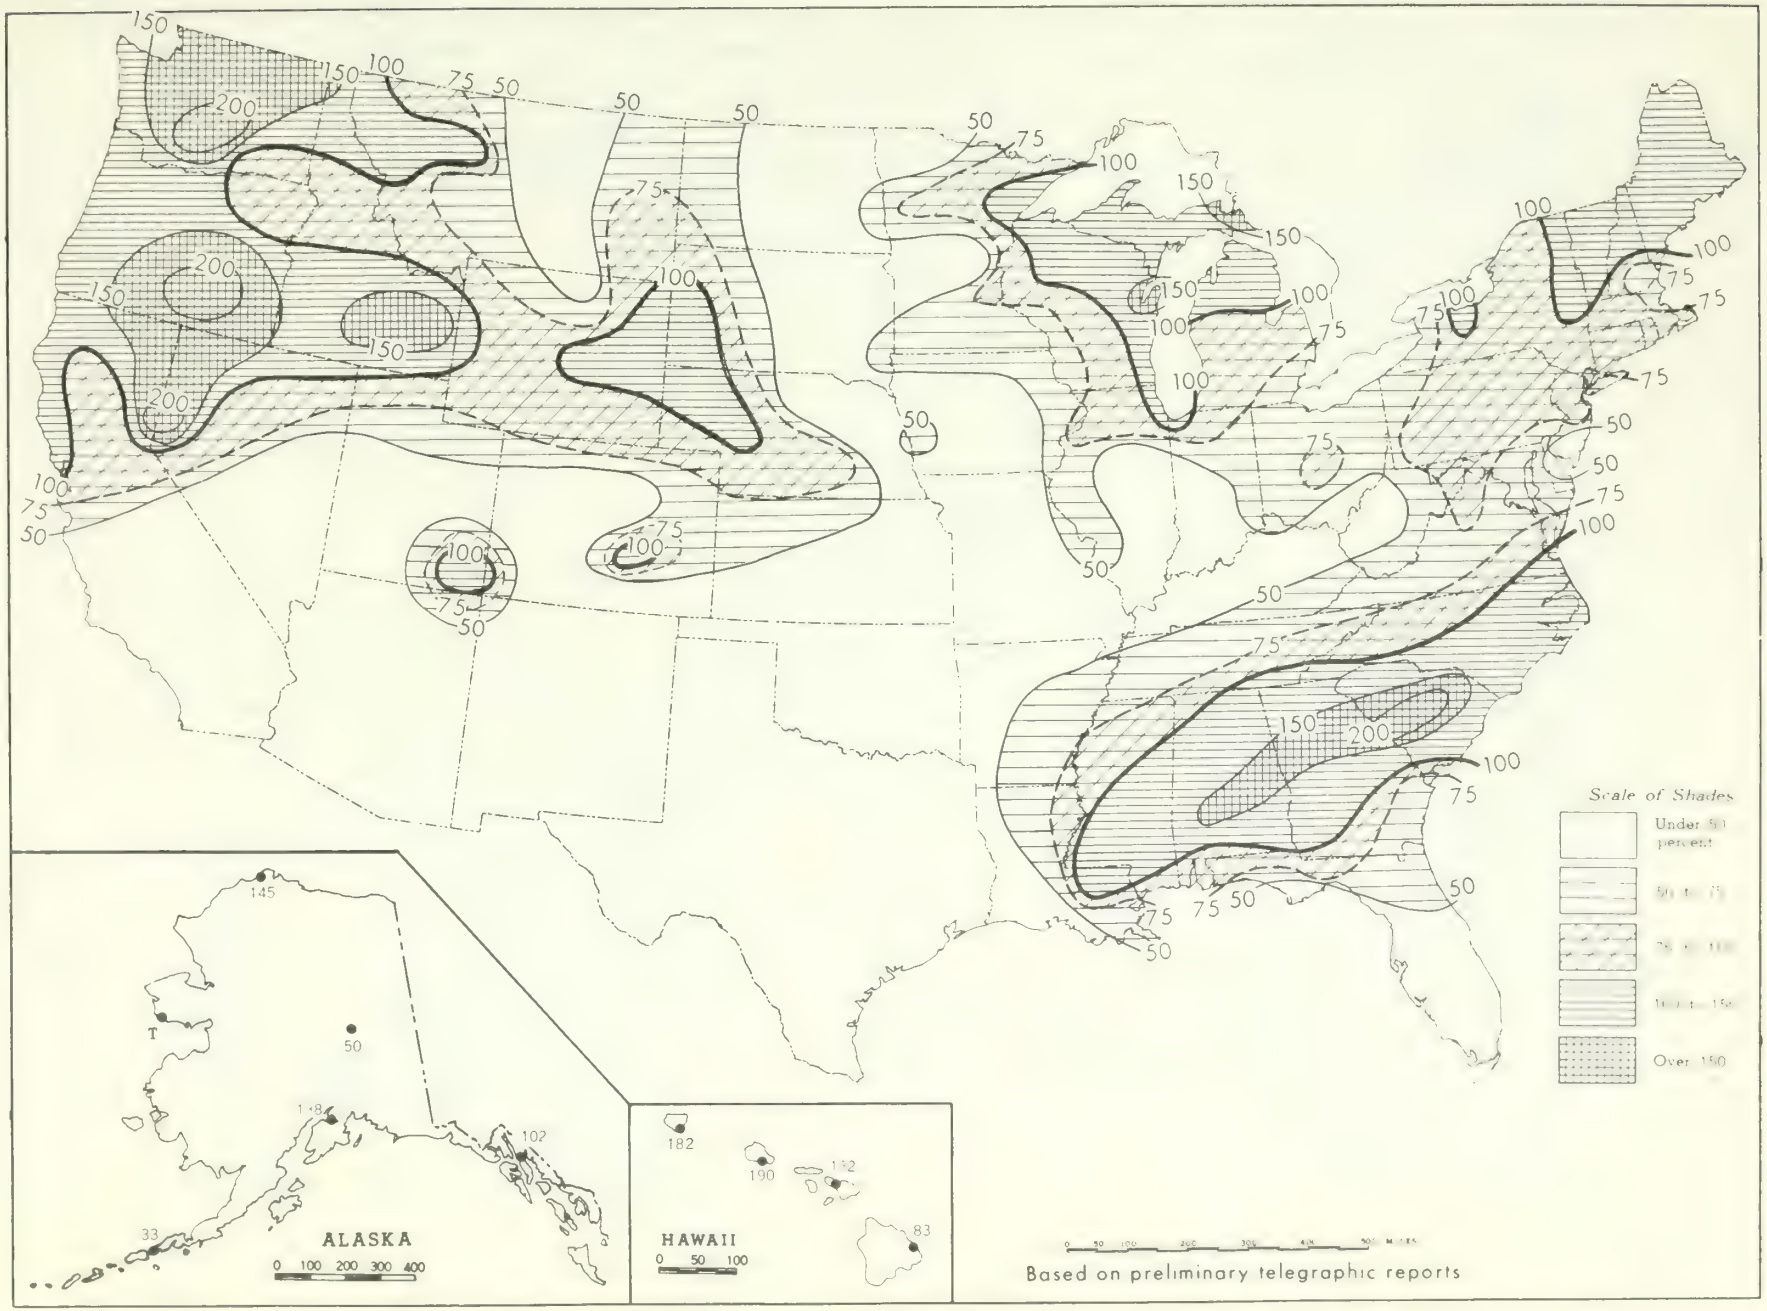

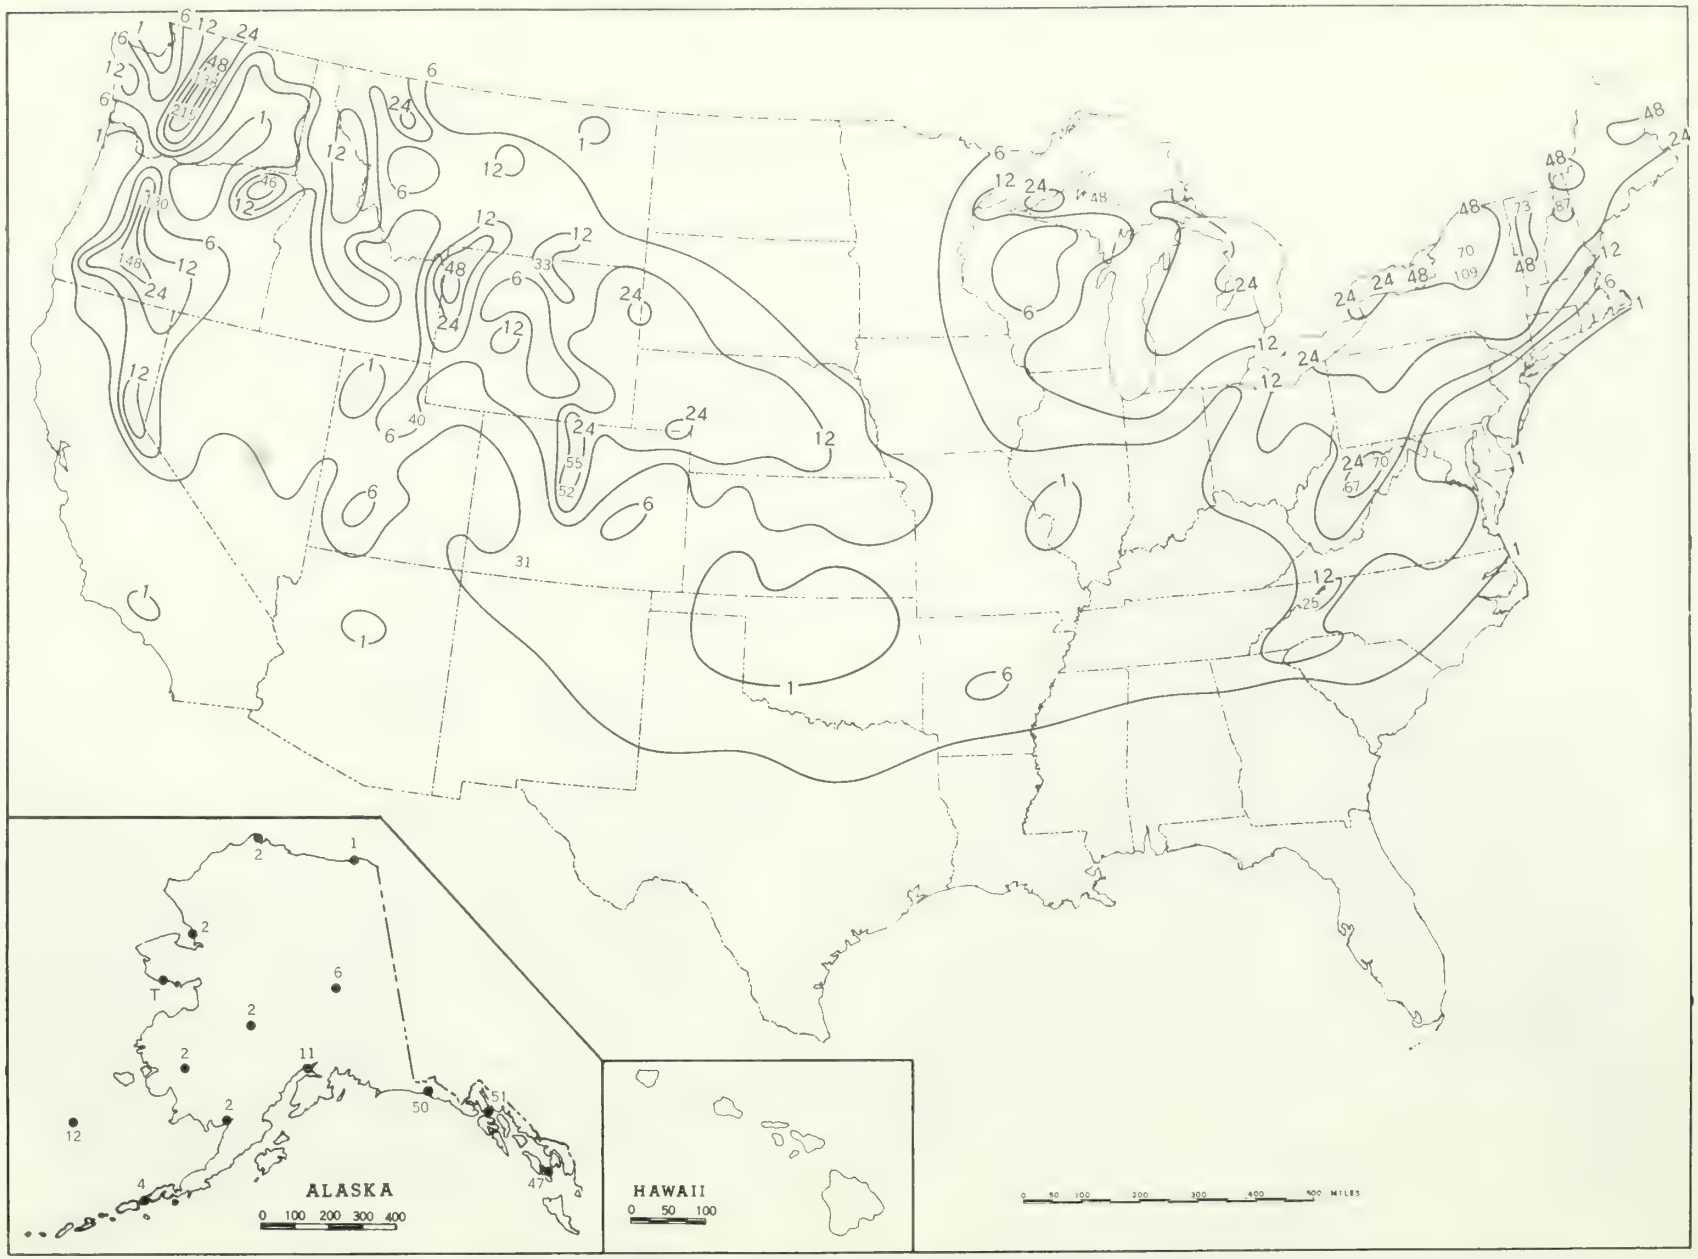

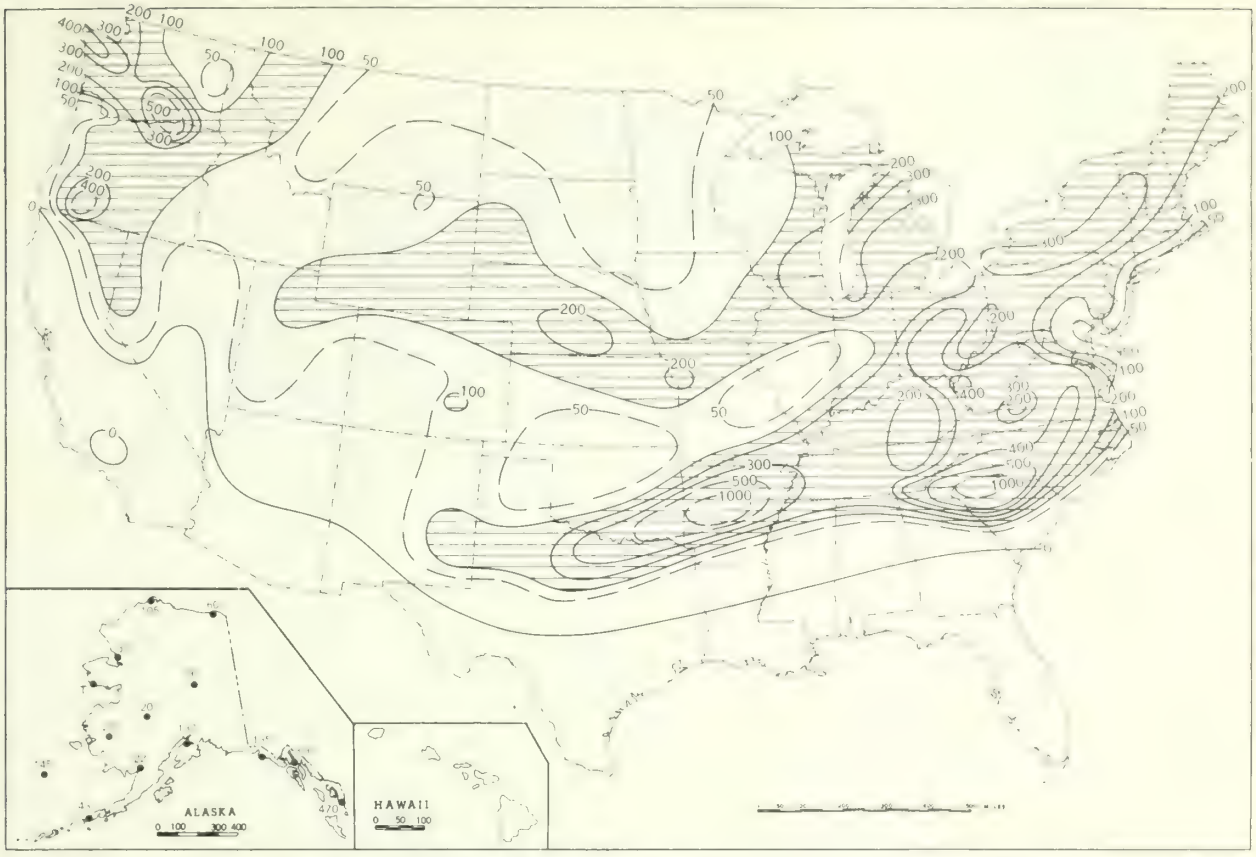

Chart IV Total Snowfall (Inches), March 1971.

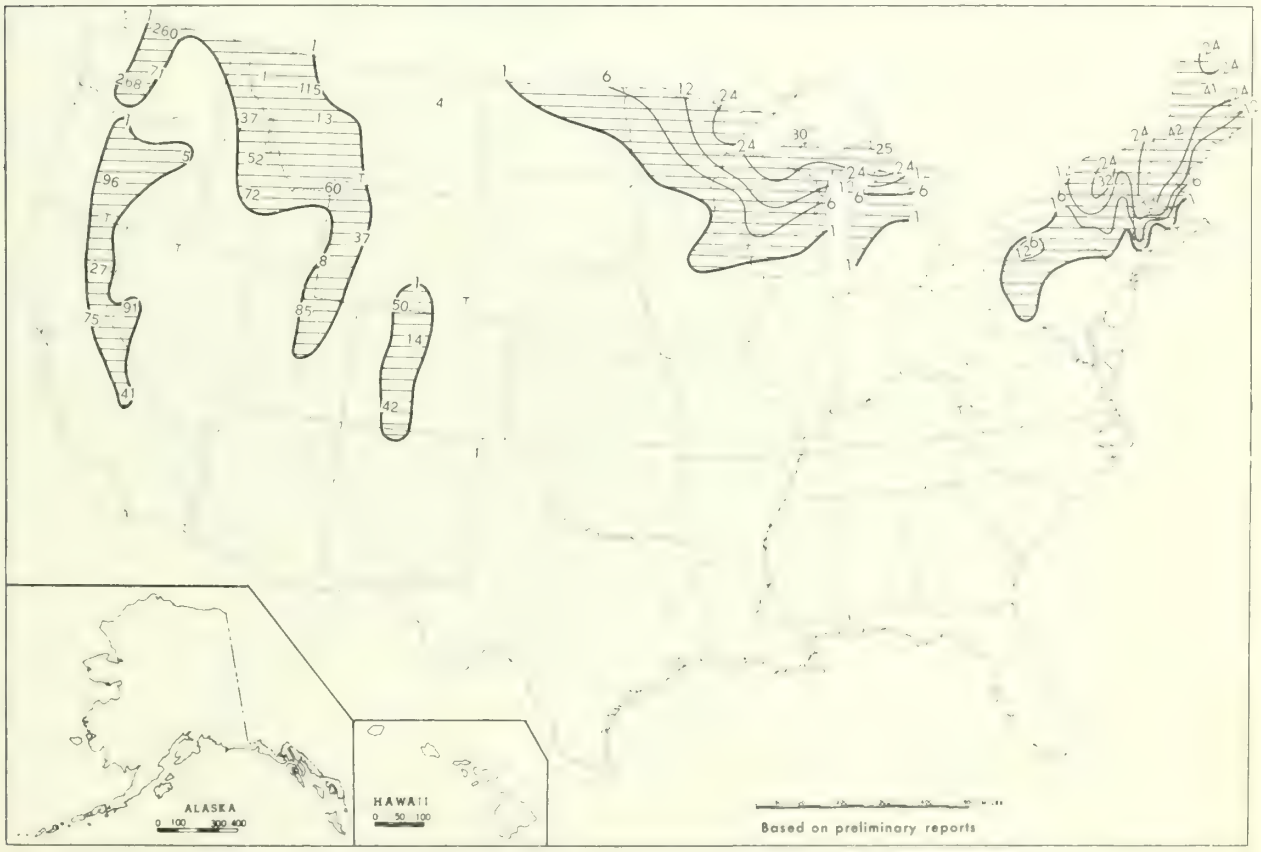
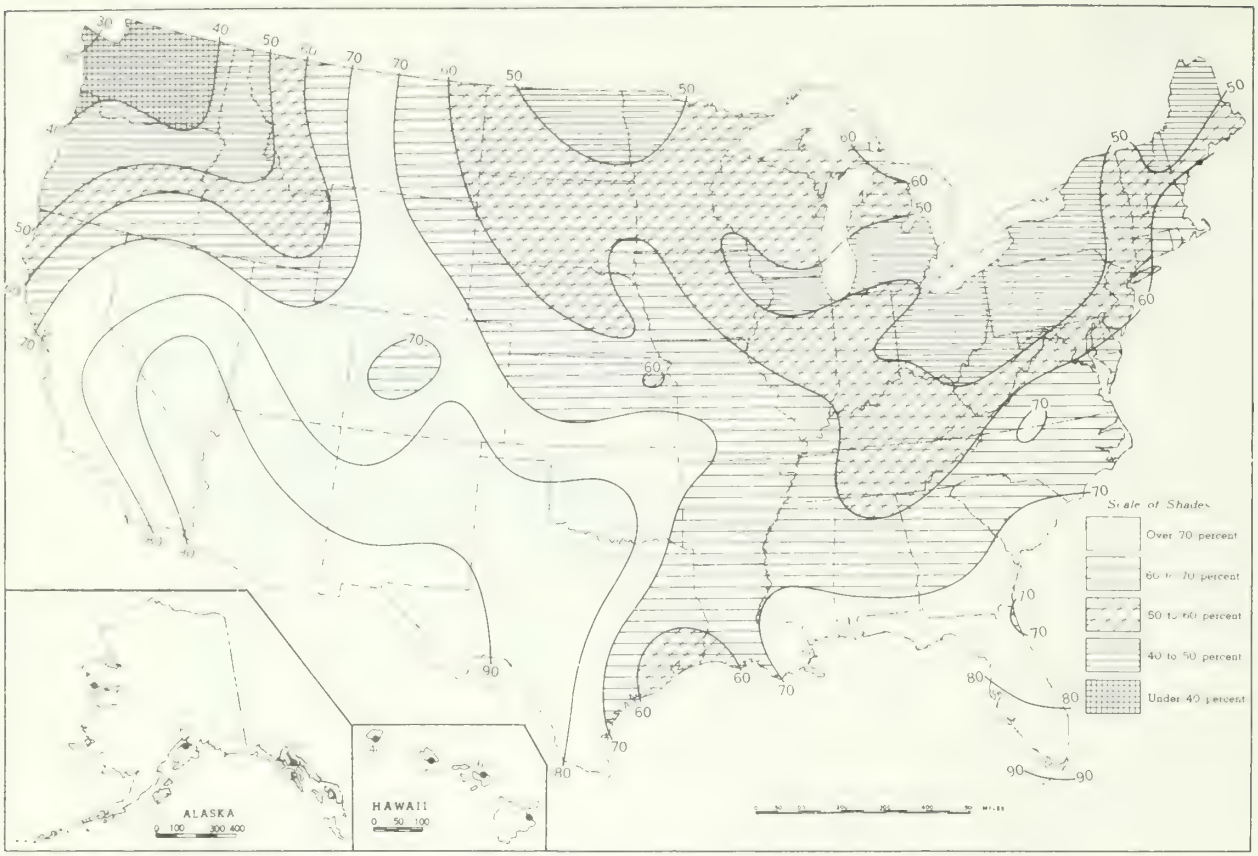
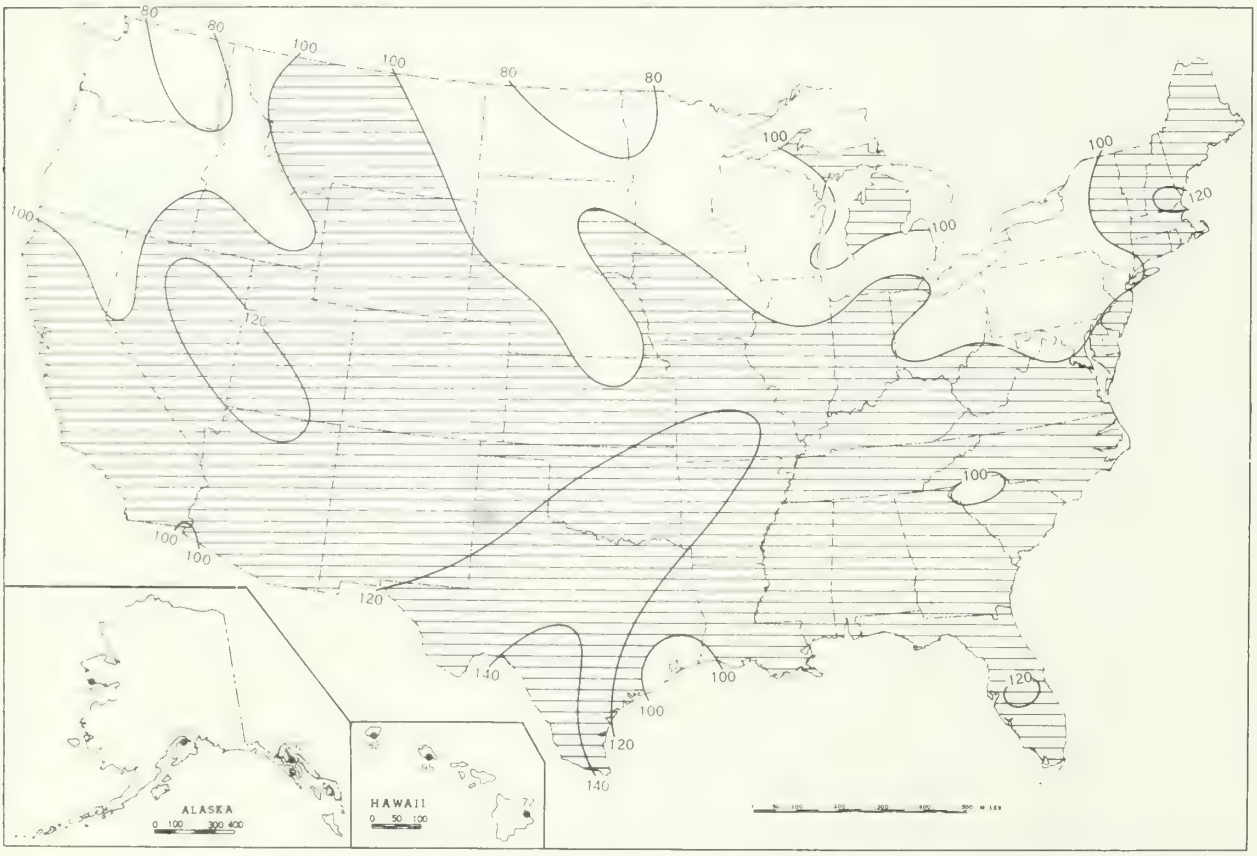


This is the total of unmelted snowfall recorded during the month at Weather Bureau and selected cooperative stations. This Chart and Chart V are published only for the months of November through April, although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year.

Chart V. A. Percentage of Mean Monthly Snowfall, March 1971.

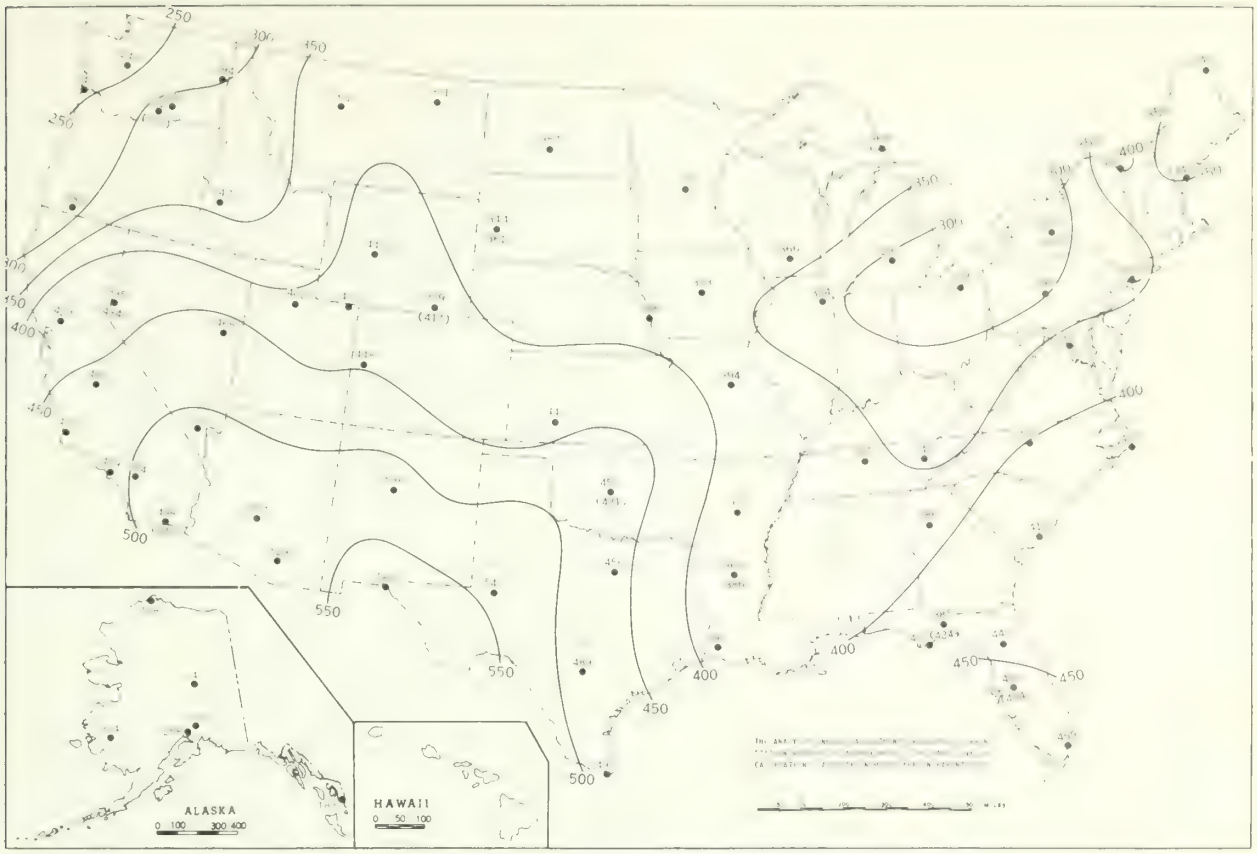


B. Depth of Snow on Ground (Inches), 7:00 a.m. e. s. t., March 29, 1971.

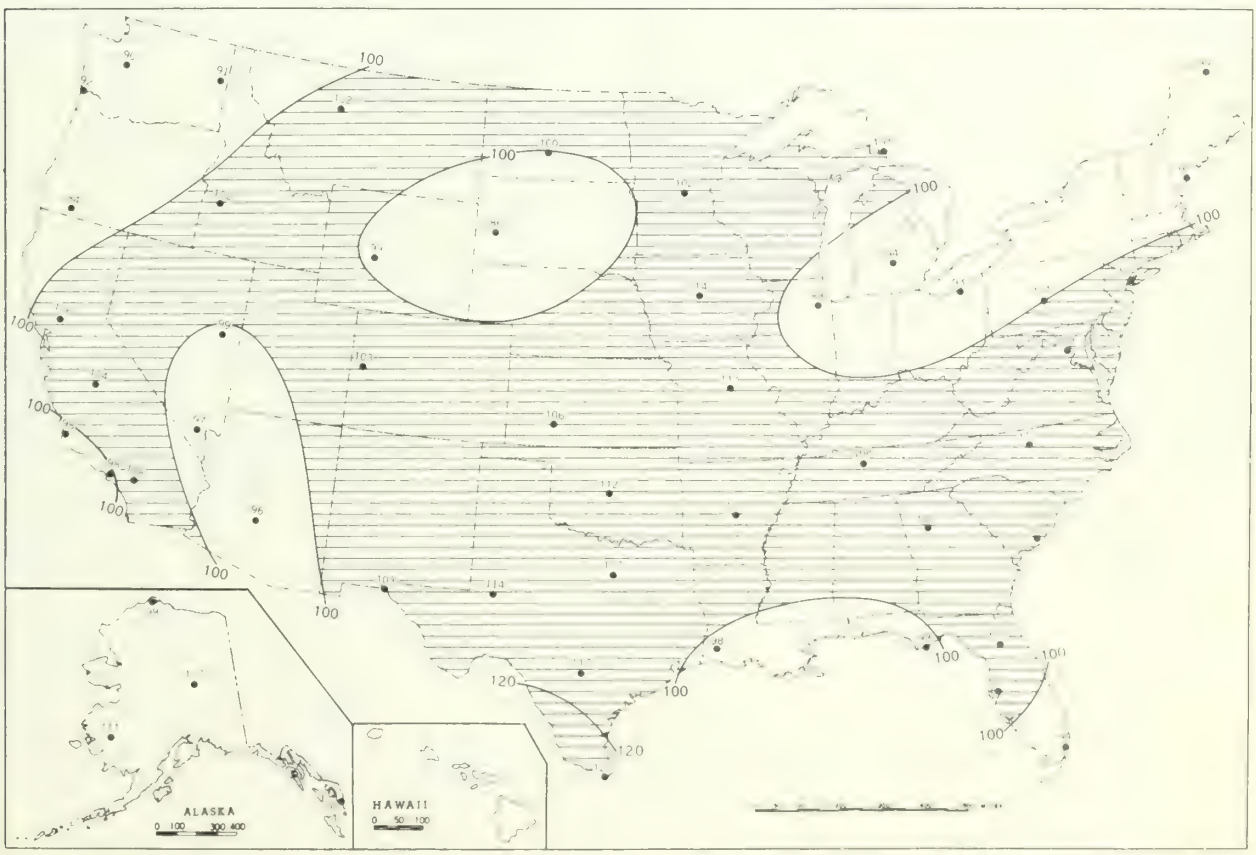


A. Amount of mean monthly snowfall is computed for Weather Bureau stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a.m. E.S.T., of the Monday nearest the end of the month.
It is based on reports from Weather Bureau and selected cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, March 1971.

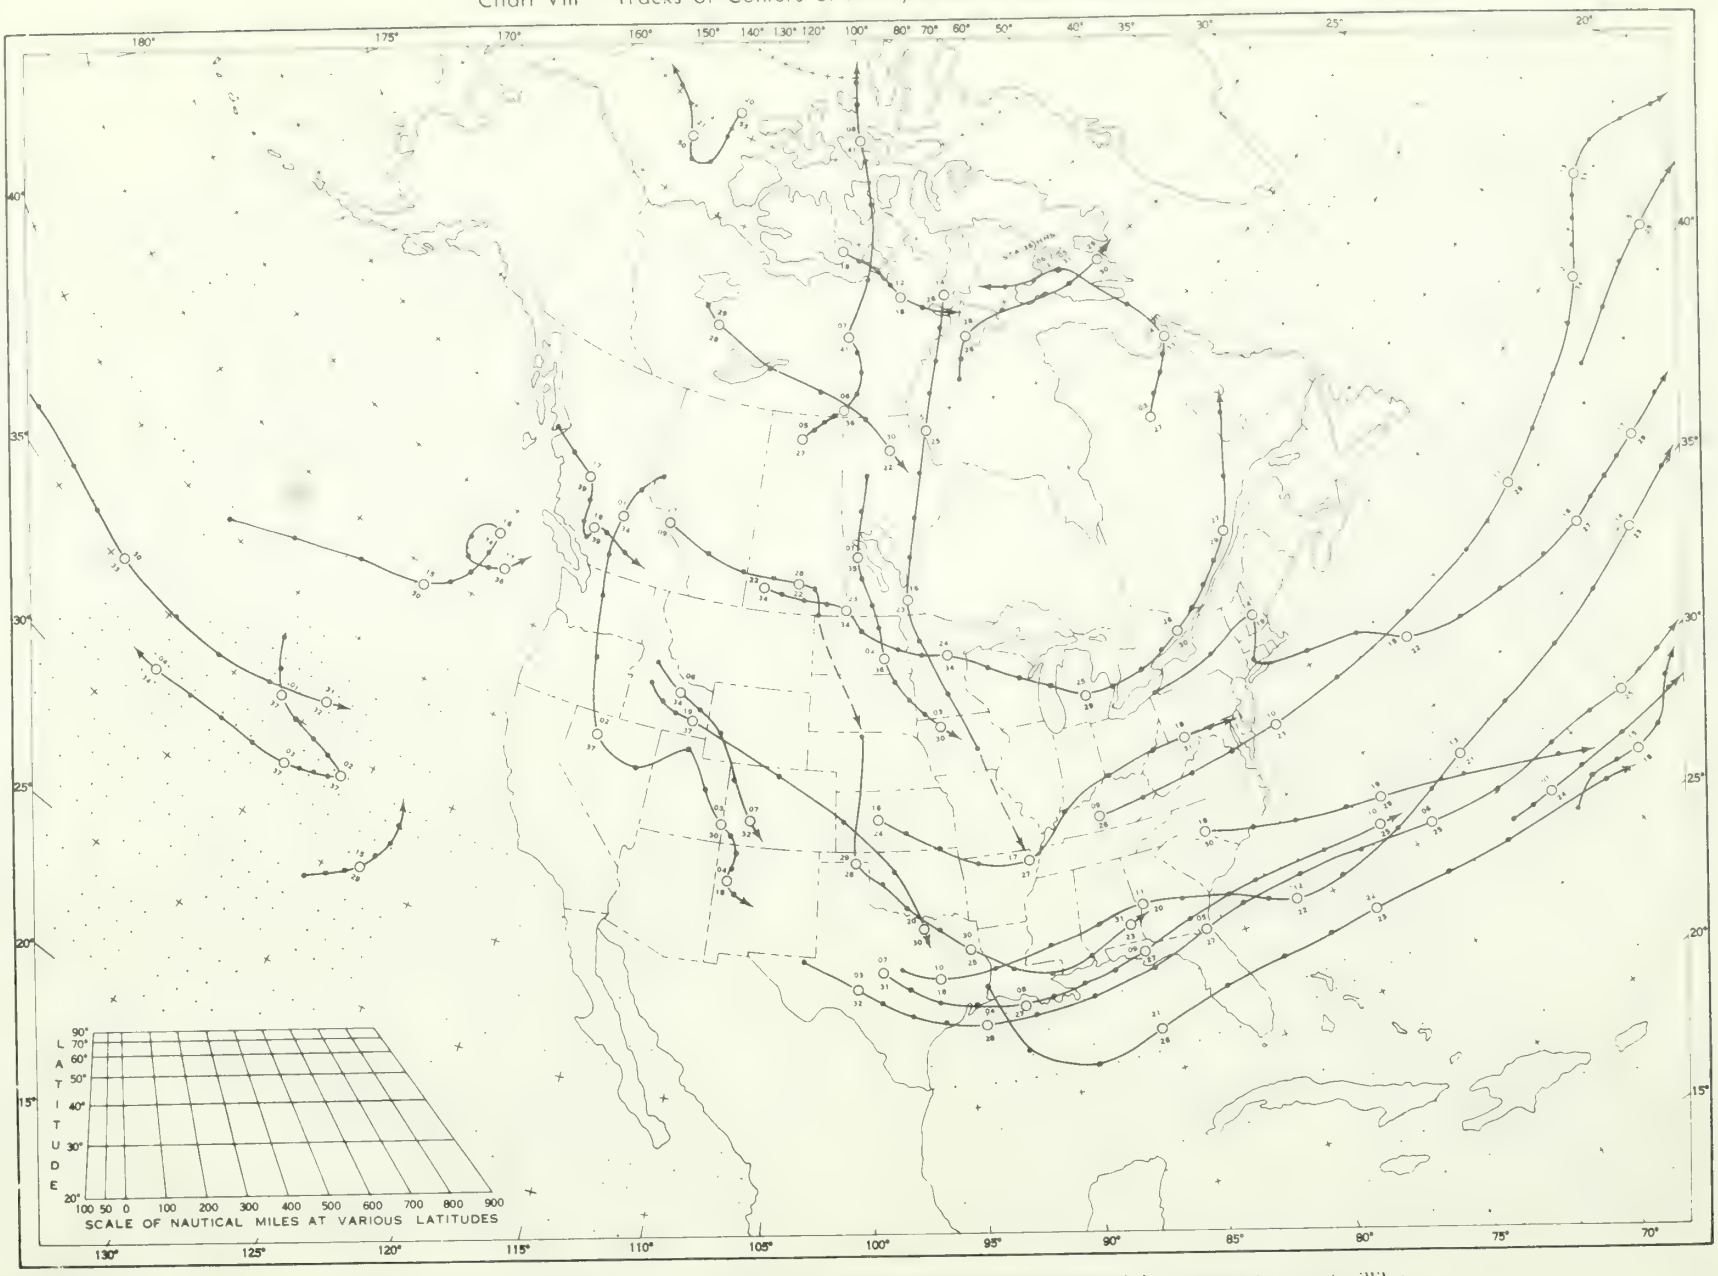


B. Percentage of Mean Monthly Sunshine, March 1971.

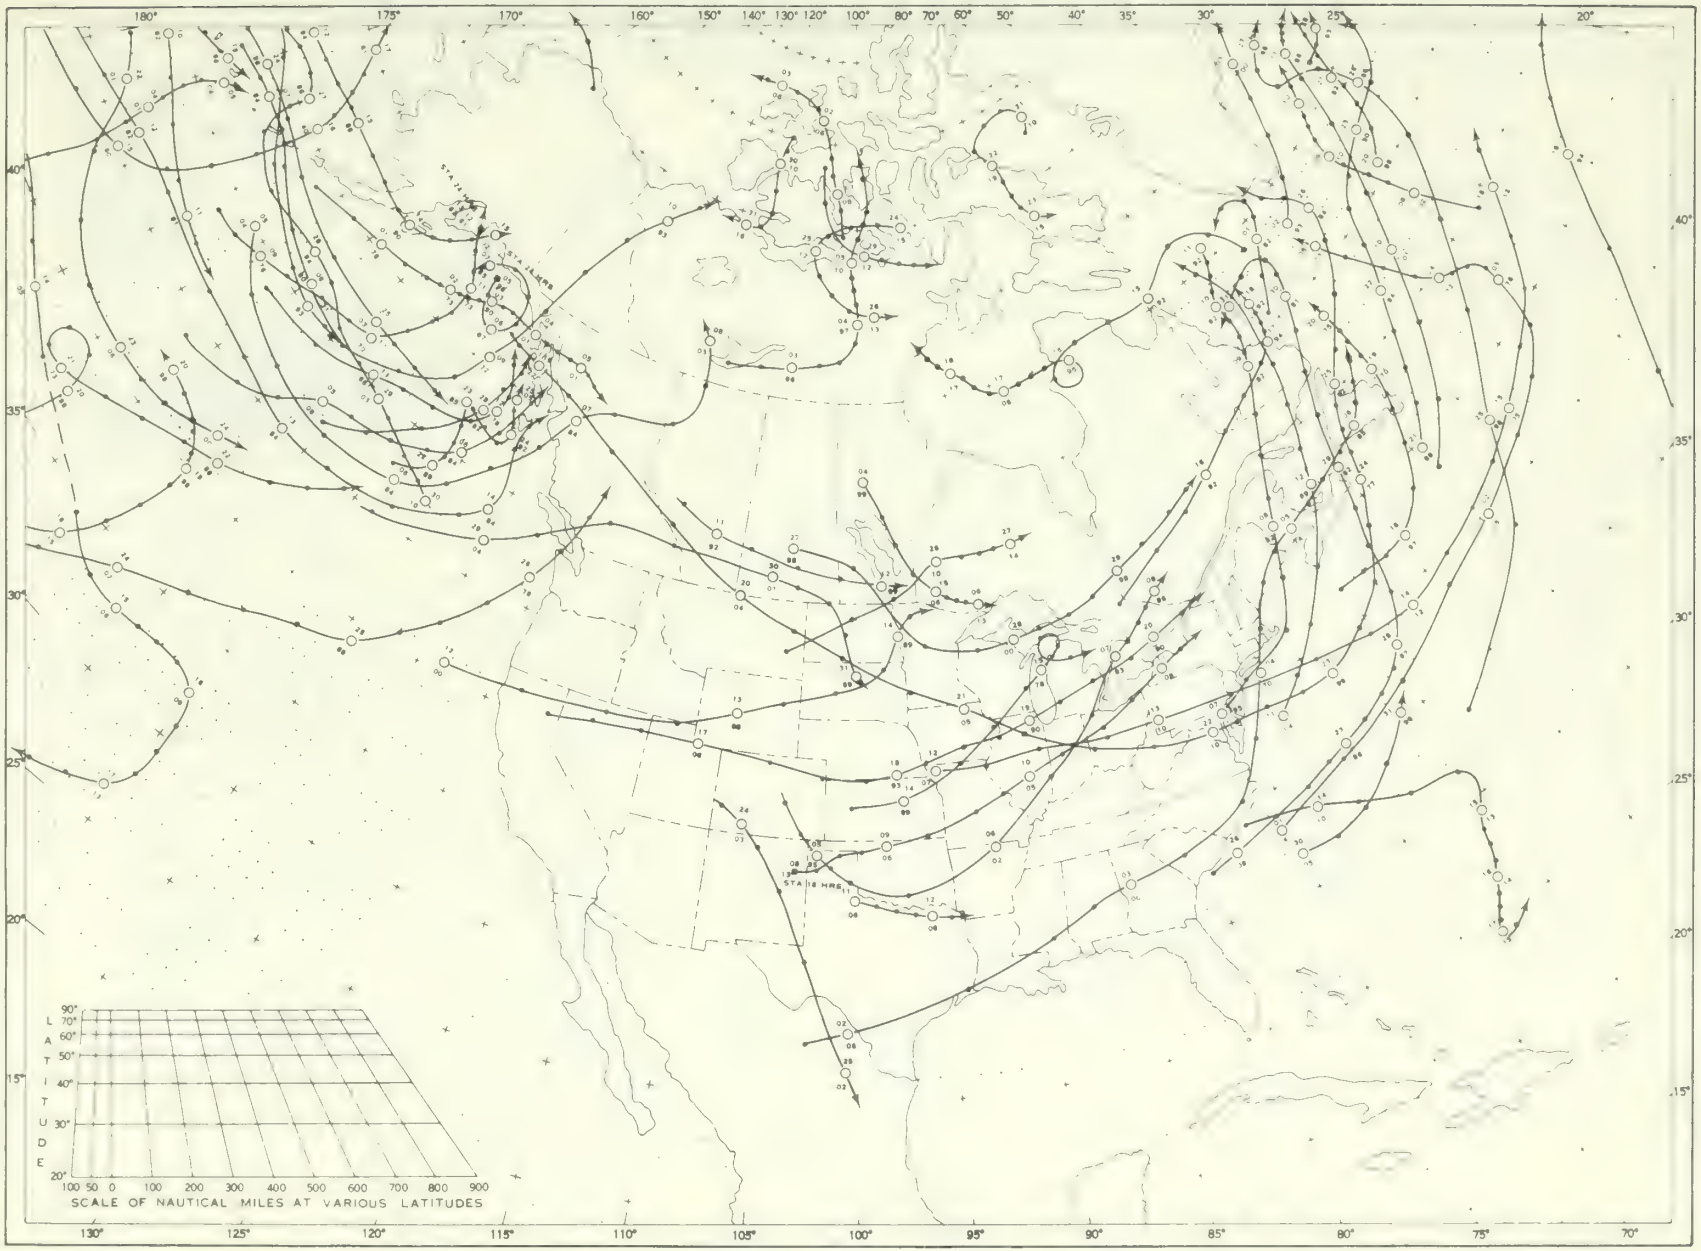


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, March 1971.

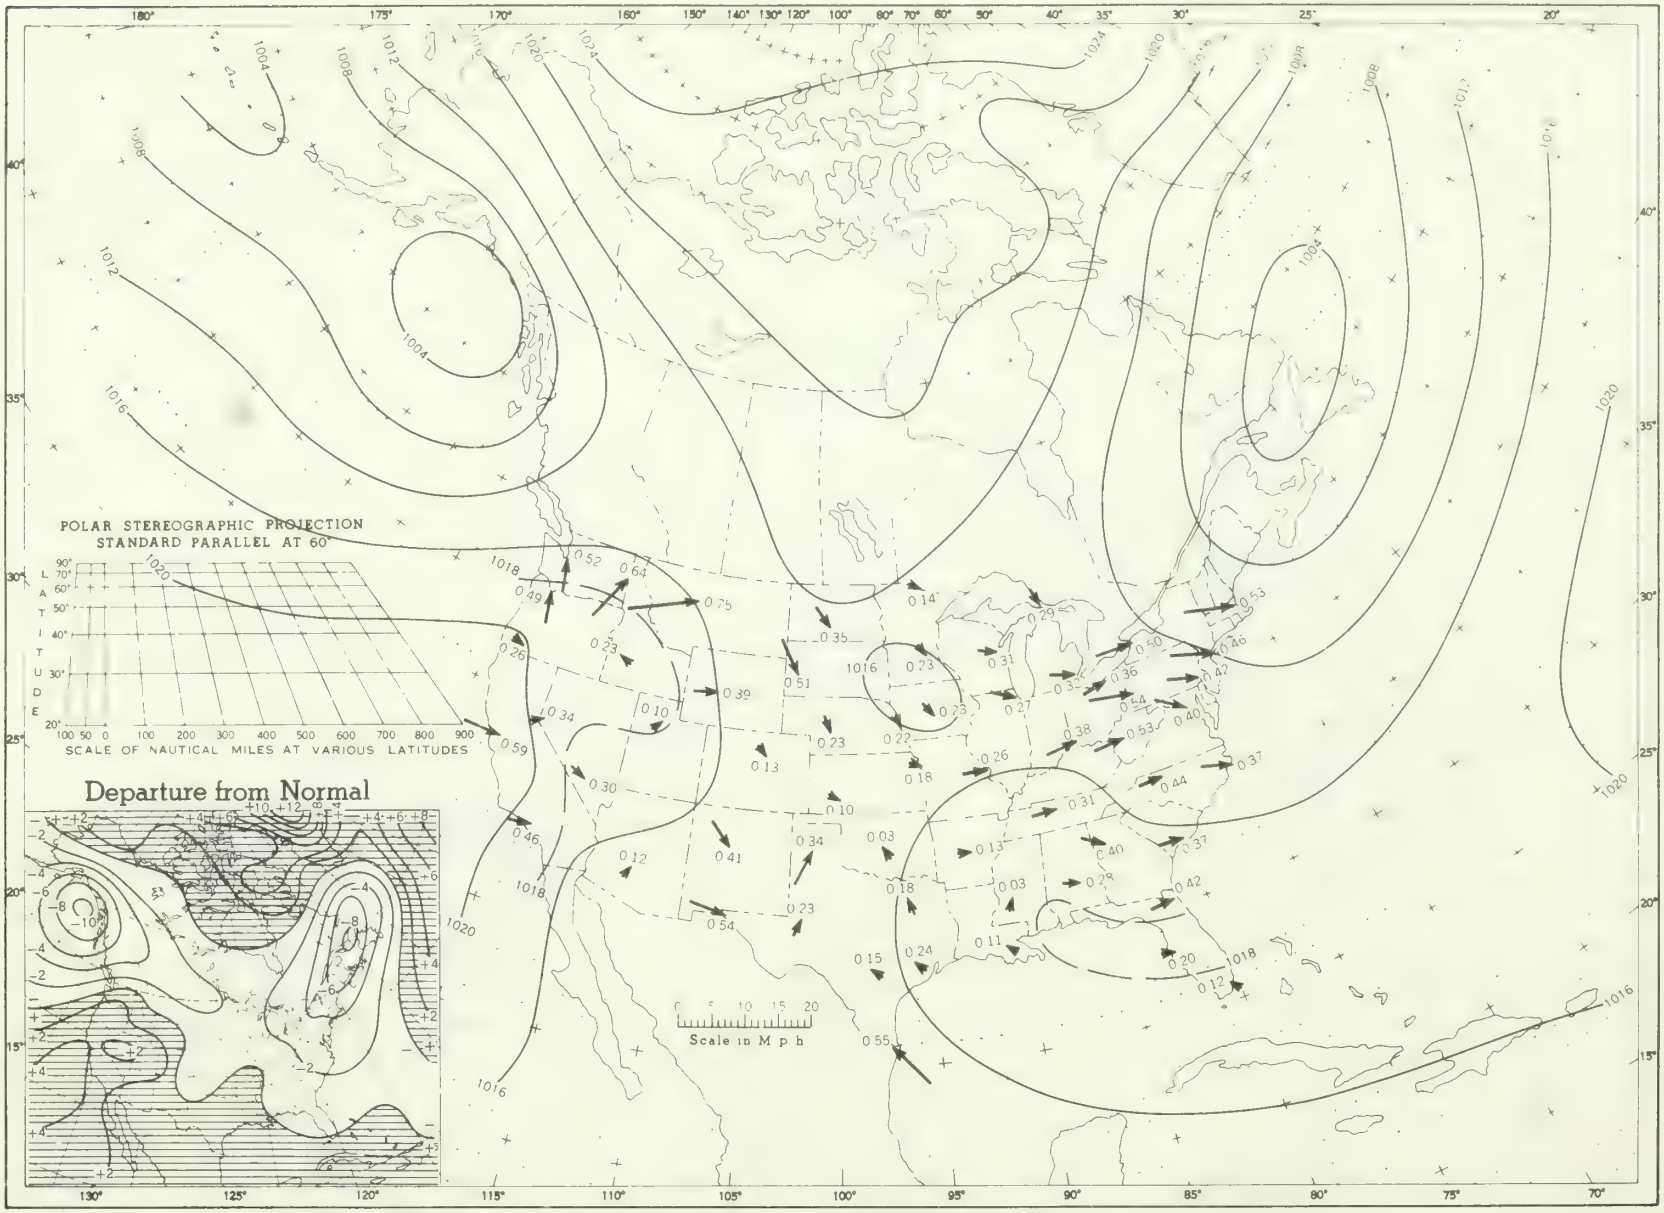


B. Percentage of Mean Daily Solar Radiation, March 1971.



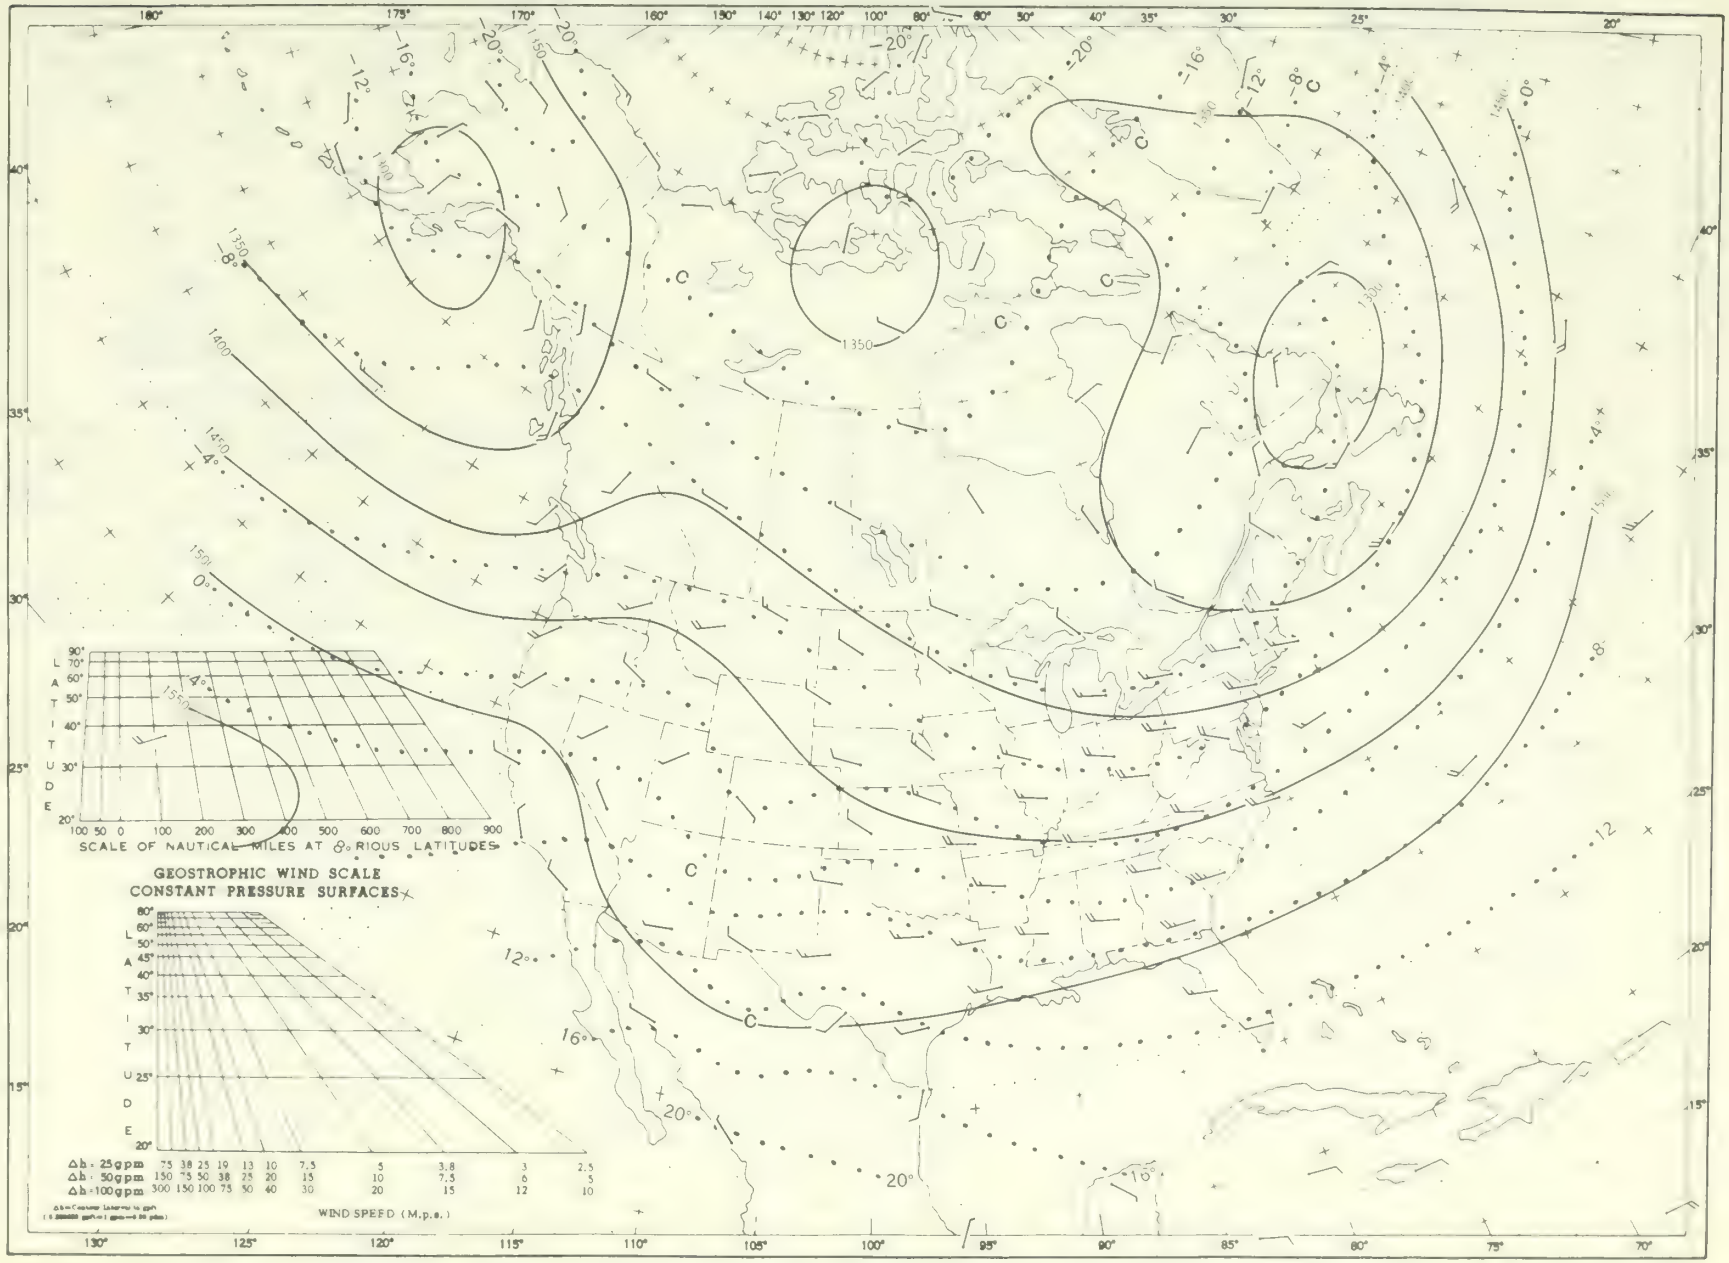
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII Tracks of Centers of Anticyclones at Sea Level, March 1971.



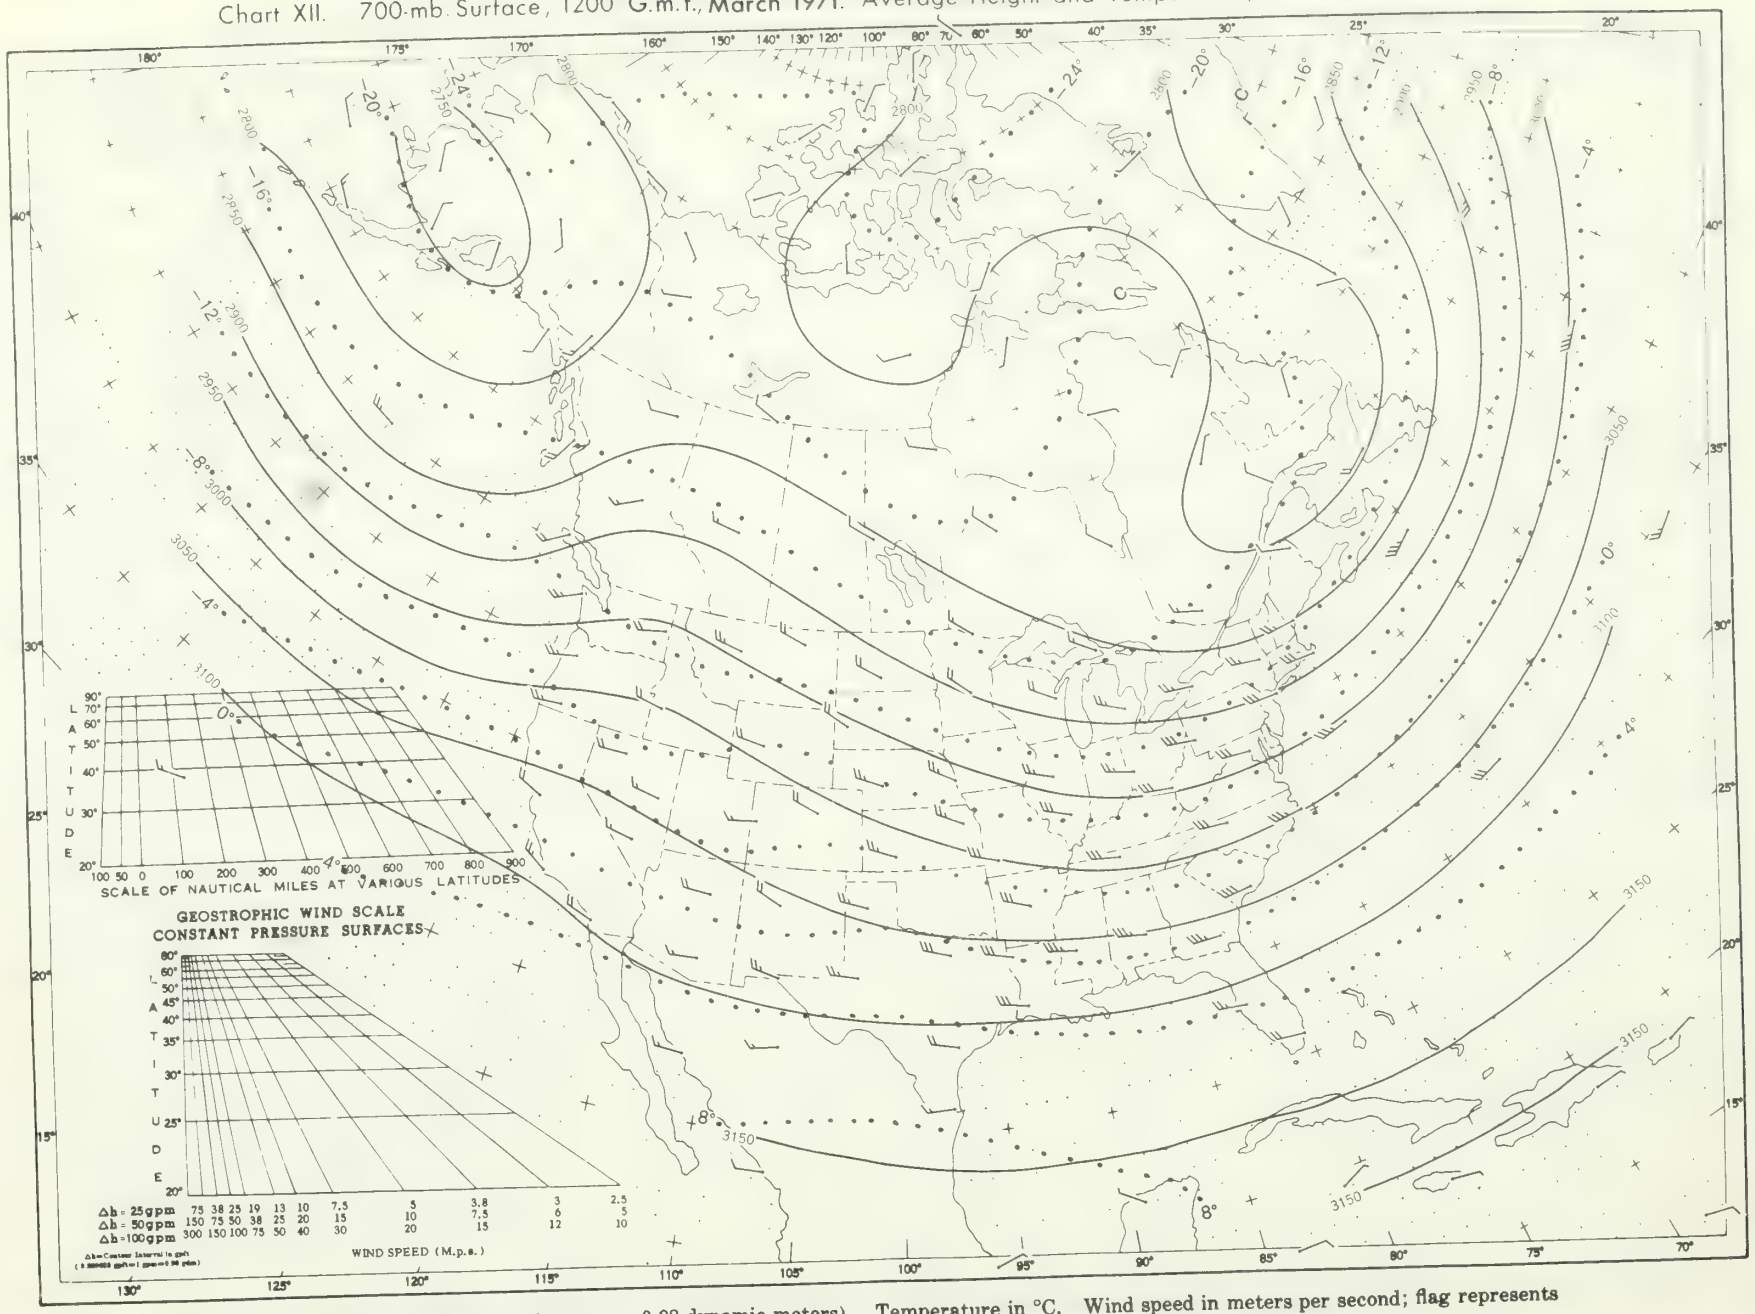
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX Tracks of Centers of Cyclones at Sea Level, March 1971.



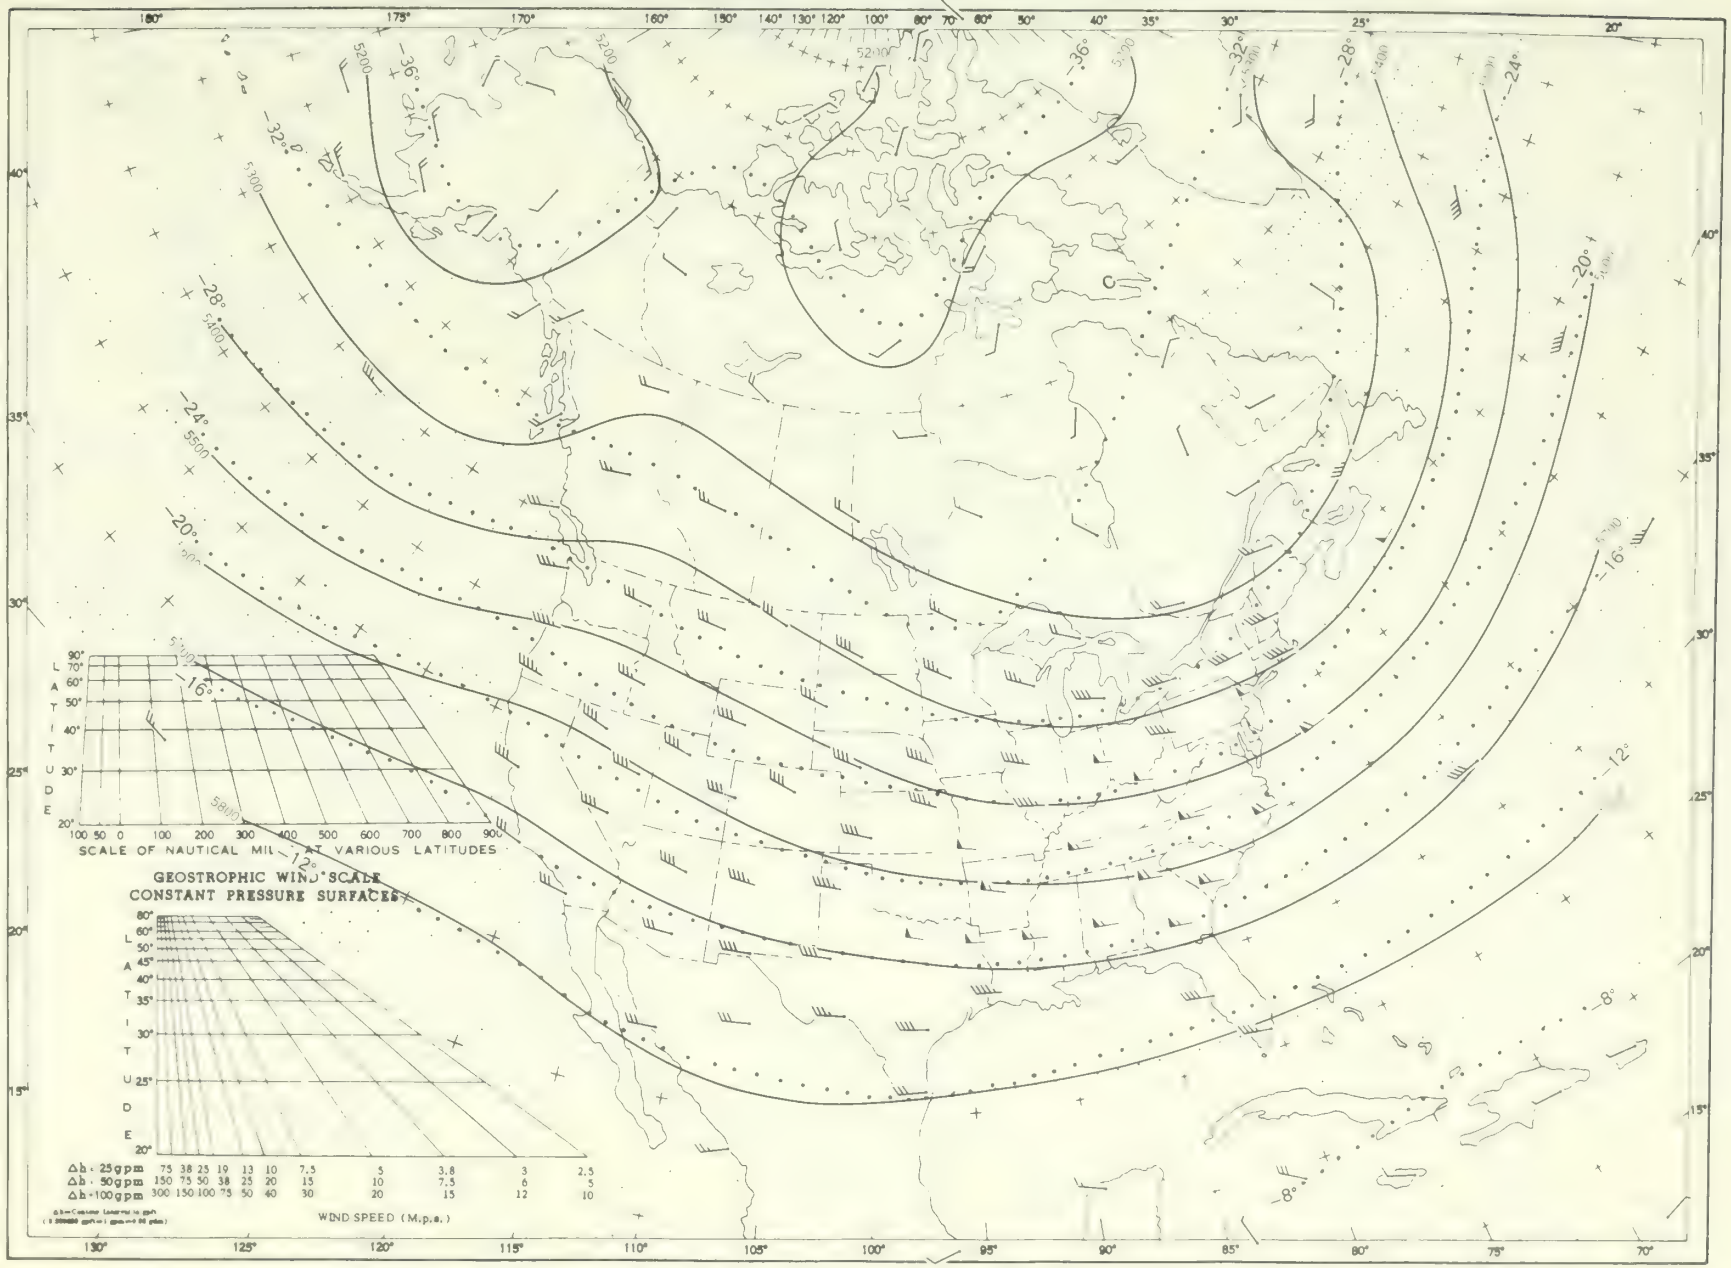
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X Average Sea Level Pressure (mb) and Resultant Surface Wind, **March 1971**. Inset Departure of Average Pressure (mb) from Normal, **March 1971**.



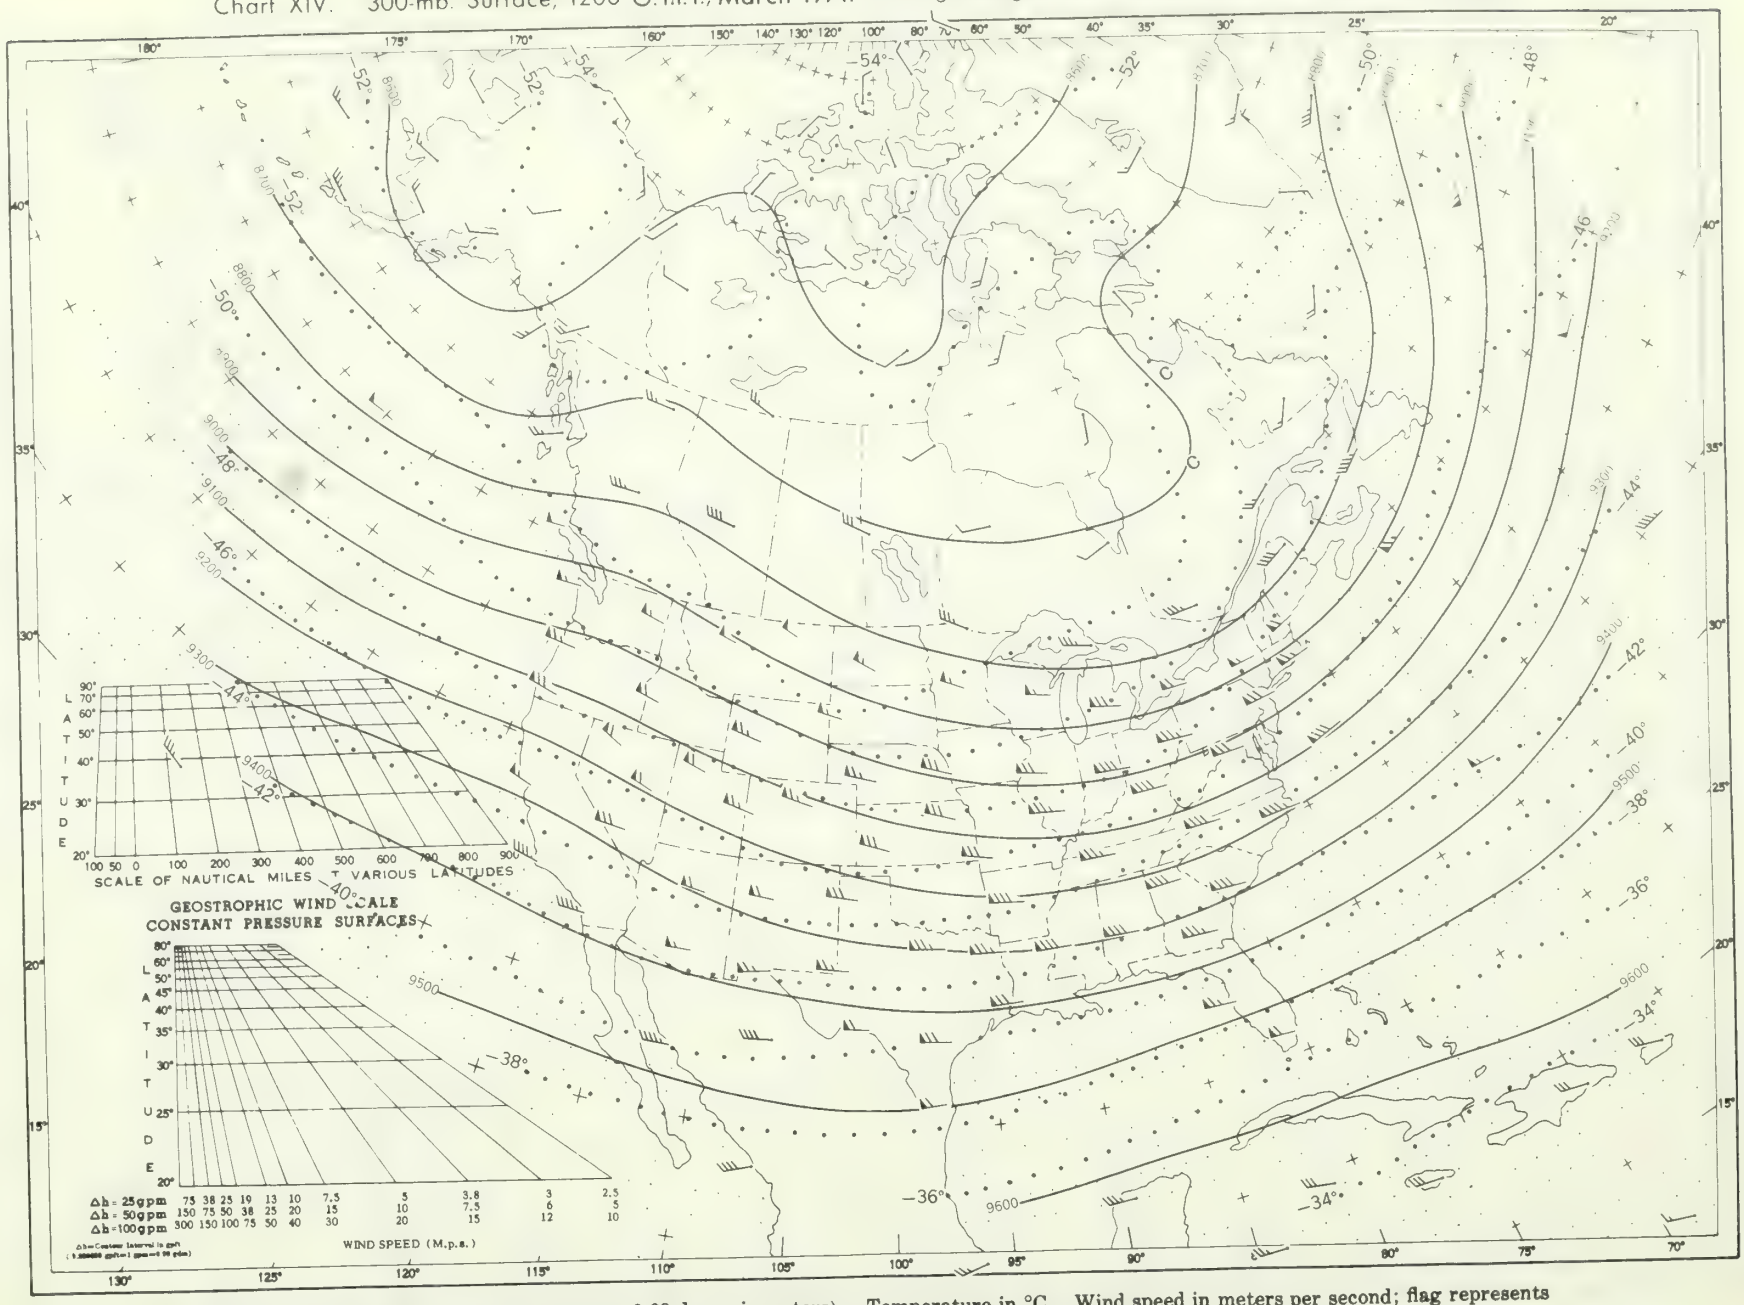
Average sea level pressures are obtained from eight daily 3-hourly observations Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10 intersections in a diamond grid over the oceans.

Chart XI. 850-mb Surface, 1200 G.m.t., March 1971. Average Height and Temperature, and Resultant Winds



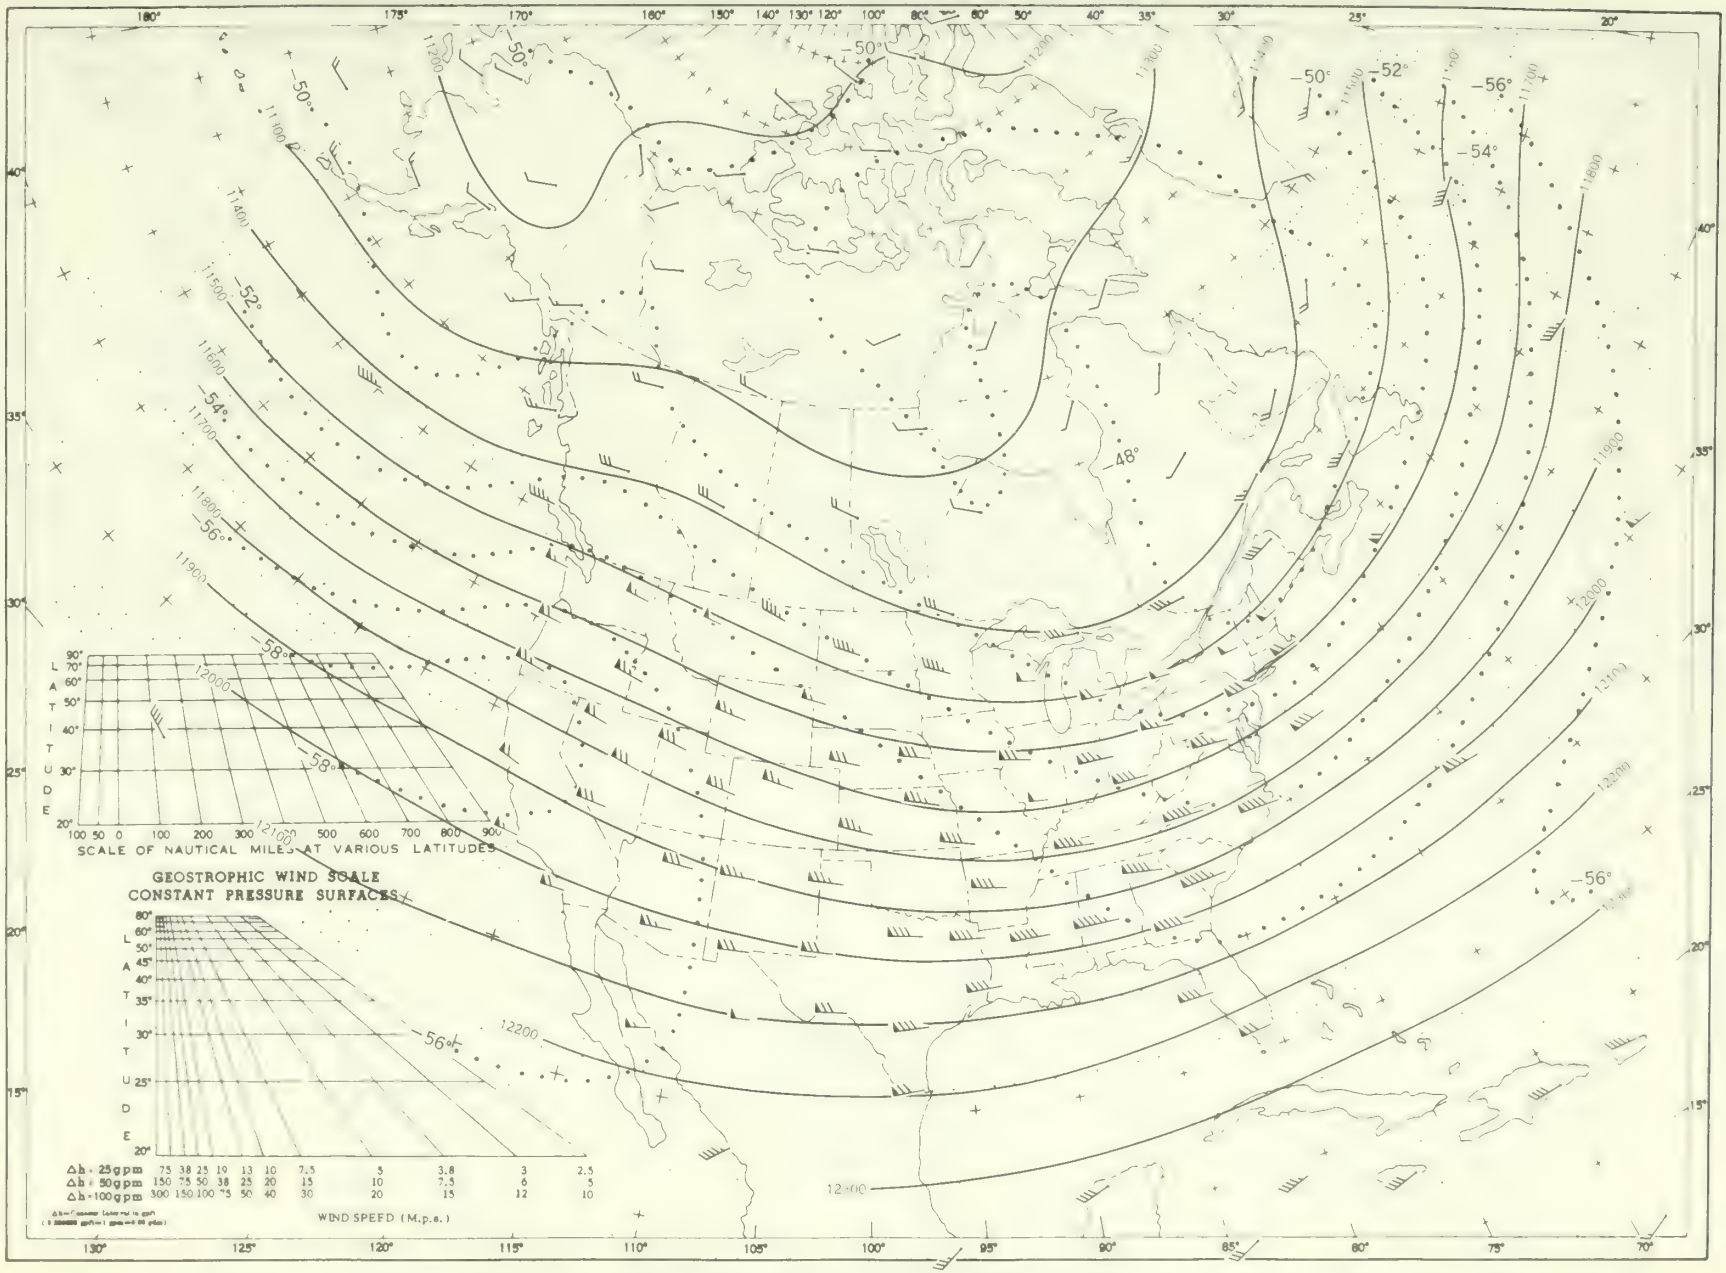
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 G.m.t., March 1971. Average Height and Temperature, and Resultant Winds



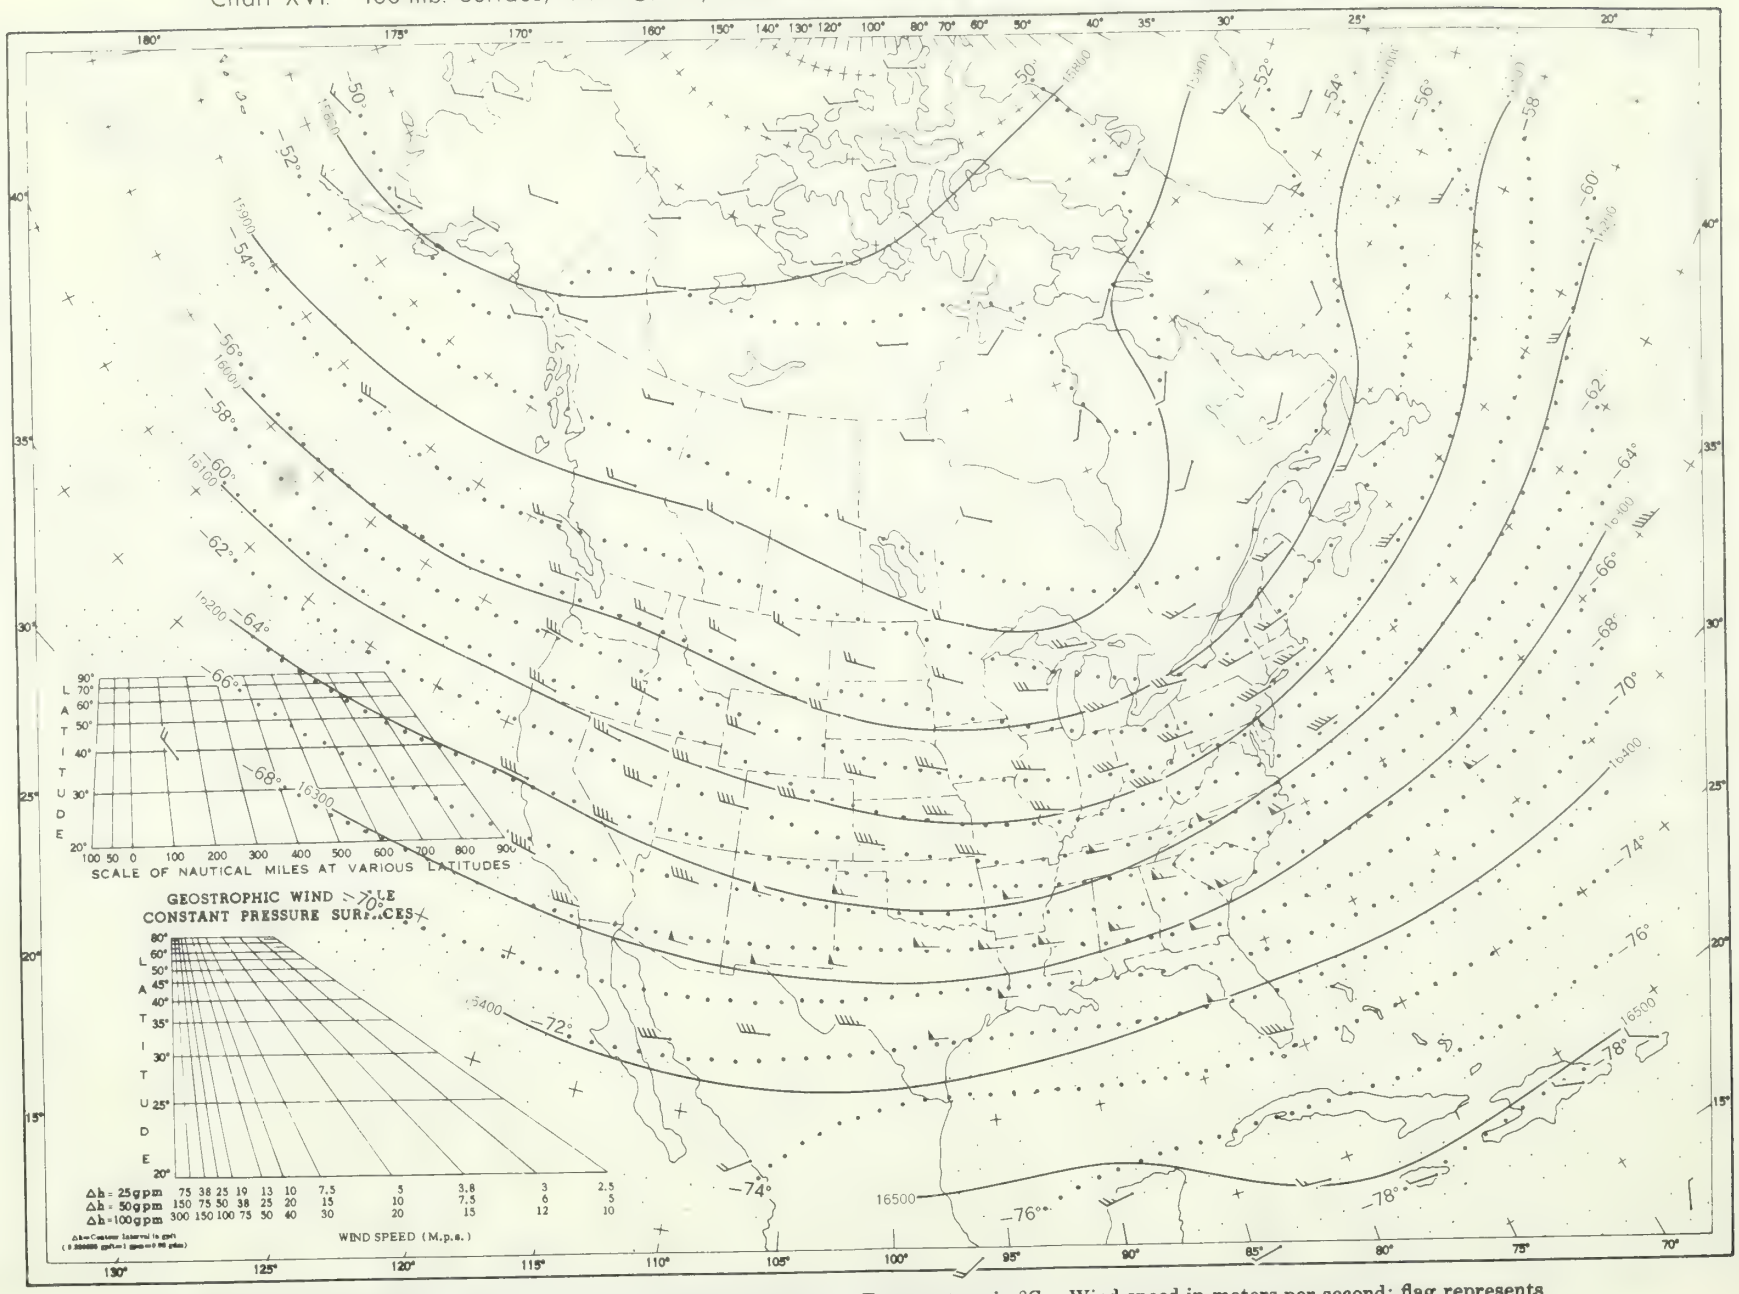
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 G.m.t., March 1971. Average Height and Temperature, and Resultant Winds



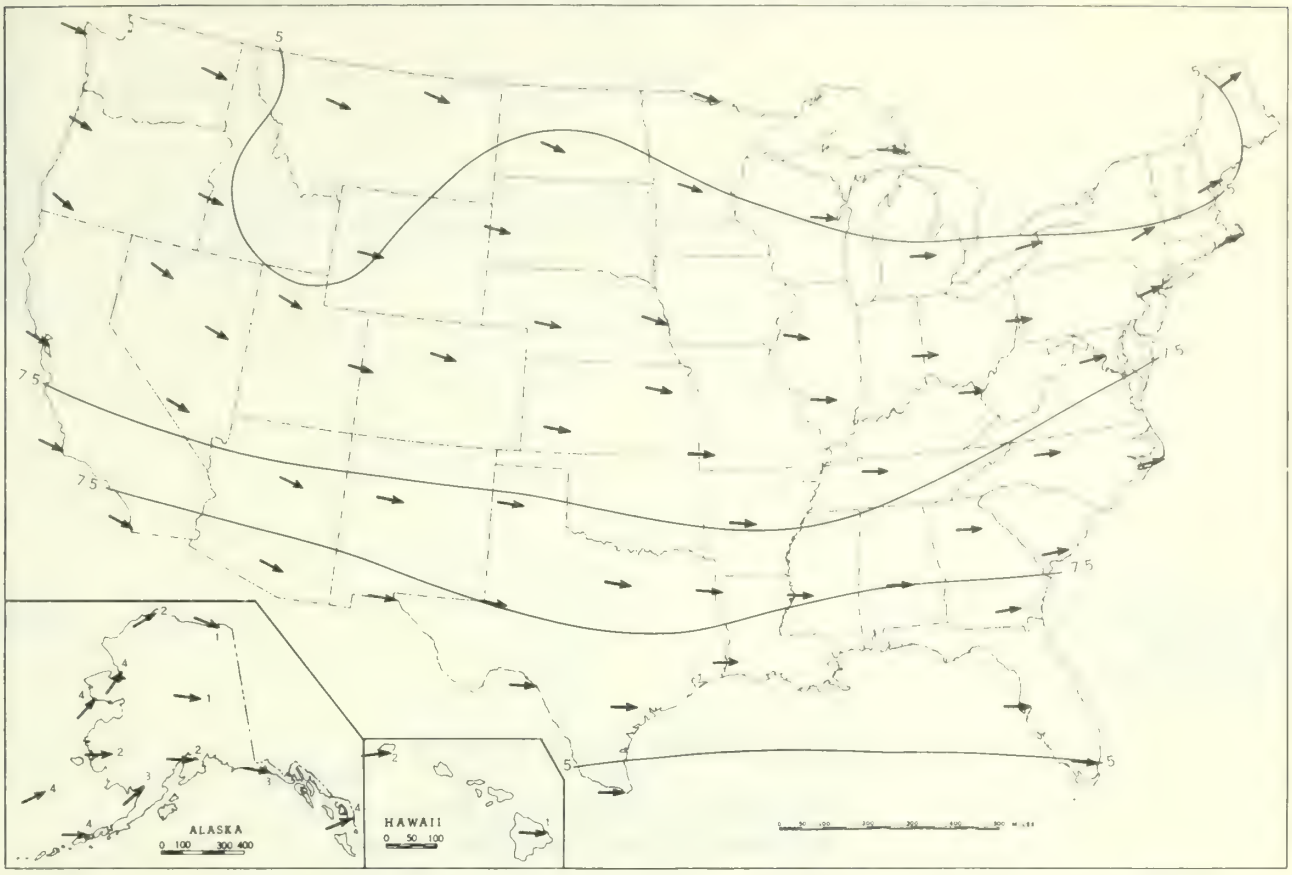
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV. 300-mb. Surface, 1200 G.m.t., March 1971. Average Height and Temperature, and Resultant Winds.



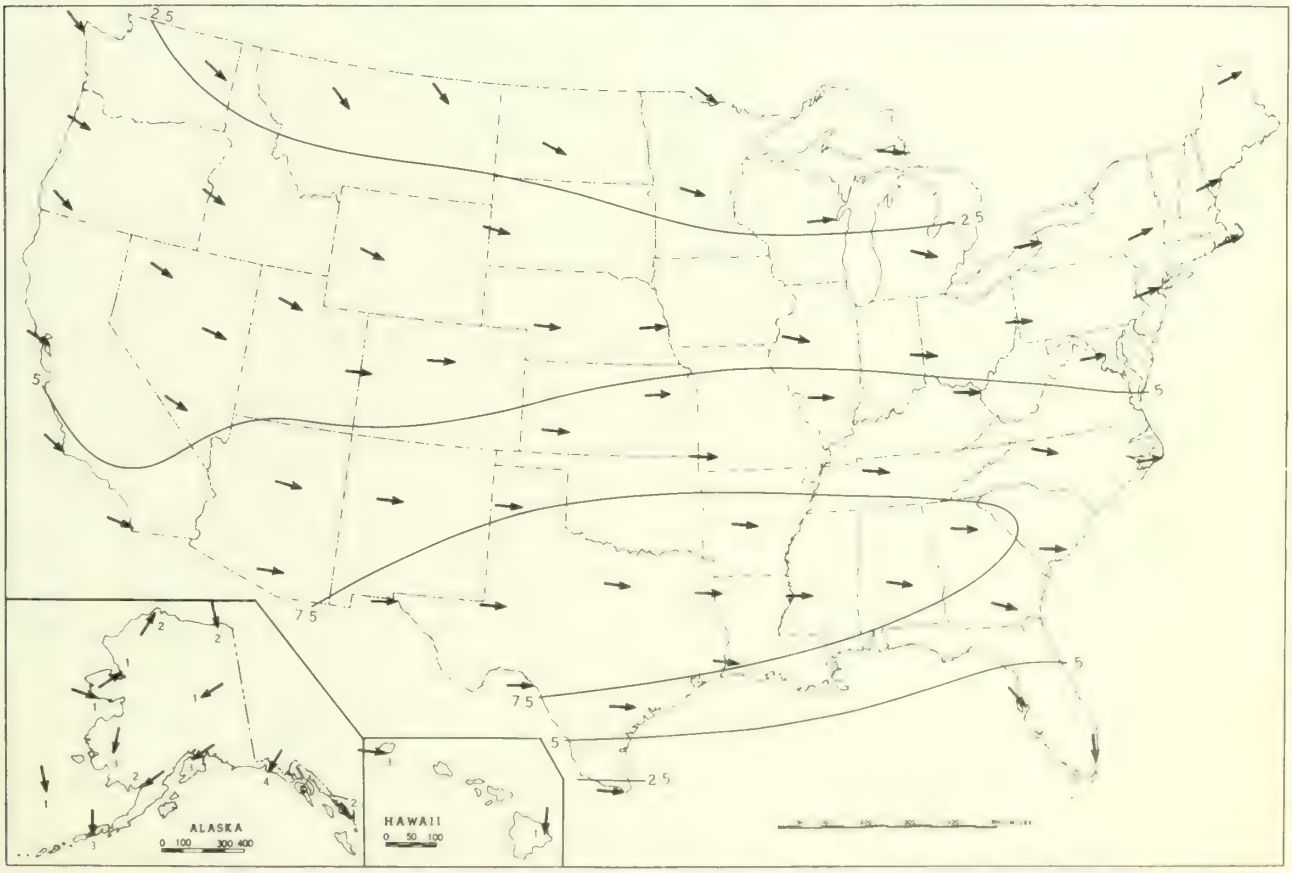
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV. 200-mb. Surface, 1200 G. m.t., March 1971. Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI. 100-mb. Surface, 1200 G.m.t., March 1971. Average Height and Temperature, and Resultant Winds.



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 G.m.t., March 1971. Resultant Winds.

B. 30-mb. Surface, 1200 G.m.t., March 1971. Resultant Winds.

Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 22 No. 4 APRIL 1971

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Mild weather predominated over the Missouri River Basin and the Upper and Middle Mississippi River Basin. The rest of the Nation averaged cooler than normal.
2. Sunny, cloudless skies prevailed over most of the Nation early in the month. Storminess increased becoming severe in some areas in the last 10 days of April.
3. The drought in southern Florida intensified.

TEMPERATURE--April temperatures averaged above normal over the northern and central Great Plains, in a small area in central Texas and along the east coast of the southern half of the Florida peninsula, and below normal over most of the rest of the Nation.

The Far West experienced relatively cool weather throughout the entire month of April. The Great Basin, the Rocky Mountains, and the western edge of the central Great Plains averaged warmer than normal through the first half of April but cooled quickly shortly after midmonth. Ely, Nev., registered 18° and Bryce Canyon, Utah, 15° on the morning of the 19th, and Truckee, Calif., recorded 13° on the 21st. Many stations in the Great Basin averaged several degrees cooler in the fourth week of April than in the two previous weeks. The Northeast also cooled in the last 10 days of April. In contrast, spots in southern Texas and the Florida peninsula recorded record high temperatures in the last 10 days of April. The mercury at Galveston, Tex., reached 86° on the 23d. This is the highest temperature of record for so early in the season at Galveston. Similar temperature records were equaled or exceeded in the Florida peninsula.

PRECIPITATION--Sunny, cloudless skies prevailed over much of the Nation in the first 10 days of April. Most of the southwest quarter of the Nation received no rain and only light scattered sprinkles fell in the Great Plains. Strong winds filled the air with sand and dust in the Great Basin and in the western portions of the Great Plains.

A low pressure system crossed the Florida peninsula and moved northward along the Atlantic coast, bringing 1.00 inch or more of rain to coastal areas from central Florida to southern New England. The drought in southern Florida intensified. Rain fell from the Lower Ohio River Valley to the southern Atlantic Coastal States and heavy snow blanketed portions of Missouri and Illinois before spreading eastward to Tennessee, then northeastward to New England.

About midmonth, a Low off the California coast moved southeastward to northern Mexico. It produced some light to moderate showers in the thirsty area from southern California to western Texas and moderate to heavy showers over central and eastern Texas. The showers brought some relief to areas that had received little rain in several months and caused flash flooding along some of the streams.

The last 10 days of the month were especially stormy in parts of the Nation. A storm centered in the central Rocky Mountains dumped heavy snow in the mountains and heavy rains in the nearby Great Plains. Some streams in Nebraska and Oklahoma overflowed their banks. Large hail and a few tornadoes occurred in spots in the Deep South in the last week of April and another western storm dumped heavy snow in the Rocky Mountains in Wyoming and nearby parts of neighboring States.

Monthly precipitation totals were generally less than 1.00 inch from California to western Oklahoma and extreme western Texas. Southern Florida received from about 0.05 inch to 0.75 inch. Totals exceeded 4.00 inches along the Washington and Oregon coast and from central Mississippi to northern Georgia. Elsewhere, April totals ranged, in general, from 1.00 to 4.00 inches, being greatest east of the Mississippi River and south of the Ohio River.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day-data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

HEATING DEGREE DAYS

° Includes crop damage.
C Crop damage.
* No occurrence of storms or unusual weather phenomena reported.
‡ Includes heavy sleet storm.
Freezing drizzle and freezing rain, commonly known as glaze.
ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
† Storm damages are placed in categories varying from 1 to 9 as follows:

1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5 Million
7 $5 Million to $50 Million
8 $50 Million to $500 Million
9 $500 Million to $5 Billion.

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS
APRIL 1971

Elmer R. Nelson, Office of Hydrology

The most significant flooding during April occurred along the Canadian border in northeastern North Dakota. Farmlands on both sides of the international border were flooded due to runoff from heavy snow areas in the Pembina Basin. Dikes, built in past years and enlarged this year, held off flood waters from the Pembina River in Walhalla and Neche, N. Dak., which cut through low-lying land and park areas. Crests at Walhalla and Neche were higher than in the spring of 1969. The flood damages and cost of protection measures were estimated at $904,000.

The Chena River and other streams in Alaska remained ice covered during April. The water equivalent of snow on the ground at Fairbanks, Alaska, decreased from 8 inches on March 24 to 4 inches on April 23. However, the water equivalent of the snowpack in most of the Chena River Basin remained at least 8 inches.

HUDSON BAY DRAINAGE

Red River of the North Basin--Widespread flooding occurred along the Pembina River during April as water inundated 25,000 to 35,000 acres of agricultural lands in Canada and North Dakota. Most of the flooding was on the American side of the border. The biggest threat along the river was to Neche, N. Dak., where an intensive flood fight saved the town from the highest crest on record, 22.22 feet.

Flooding occurred to a lesser degree on the Park, Souris, Roseau, Two Rivers, and Red Lake Rivers. On the Park River, damage was chiefly to city property in the Grafton, N. Dak., area. A few trailer houses were damaged and water backed up into several basements. Flooding on the Souris River was limited to a small unpopulated area in the river bottoms below Lake Darling. Flooding on the Roseau, Two Rivers, and Red Lake Rivers in Minnesota was mainly limited to agricultural and wildlife areas adjacent to the streams. The dikes at Crookston, Minn., held back a crest of more than 5 feet above flood stage.

Light snow accumulations through the upper portion of the Red River of the North Basin, favorable temperature, and precipitation patterns contributed to lower river stages this spring. Although ground frost depths were extreme in many places this winter, the porous condition of surface soils in some areas also contributed to lower river stages this spring. The absence of frost in the Red Lake River Basin helped to reduce runoff in that basin.

The total flood damages and cost of protection measures in the Red River of the North Basin were estimated at $1.2 million. Of this total, $904,000 occurred in the Pembina Basin.

ST. LAWRENCE DRAINAGE

Lake Ontario--Canaseraga Creek at Groveland, N. Y., rose 2.5 feet above flood stage on the 13th-14th. This was the last in a succession of flood occurrences on the flatland below Dansville, N. Y. Since cultivation had not yet begun, no damage to crops or structures occurred. However, both Route 258 and Route 63 were flooded.

ATLANTIC SLOPE DRAINAGE

Snowmelt through the central and upper Connecticut Basin caused rises on the Connecticut River to 1 foot above flood stage at Hartford, Conn., on the 20th. Lowland flooding of meadows occurred but no damage resulted.

All major water-supply reservoirs in New Jersey were either 99 percent of capacity or spilling at the end of April. New York City's reservoirs on the upper Delaware increased storage by 35.7 billion gallons during April and are at 99 percent of total capacity. Both Cannonsville and Pepacton Reservoirs were spilling. Lake Wallenpaupack in the Poconos increased storage by 4.9 billion gallons and reached 84 percent of usable capacity at the end of April.

Heavy rainfall on the 6th-7th caused minor flooding on the Raritan River in New Jersey. This was a coastal storm that intensified along the Carolina coast and moved northward from Cape Hatteras. The precipitation ranged from 2 inches to over 3.5 inches in northern and central New Jersey. Some stations in the heavy precipitation area reported snowfall of 4 to 8 inches, with Greenwood Lake in extreme northern New Jersey reporting 9 inches of snowfall during the storm.

Minor overflow occurred on the Tioughnioga River at Whitney Point, N. Y., on the 13th-15th and on the Chenango River at Sherburne, N. Y., on the 14th.

Heavy precipitation during the 48-hour period ending at 7 a.m. on the 7th caused flooding on the Neuse River in eastern North Carolina on the 7th-15th. Although most of the precipitation fell as rain, snow occurred over the headwater area of the Roanoke River Basin where as much as 10 inches accumulated on the ground. Rainfall totals ranged from 1 to 2 inches, with local amounts up to 3 inches along the coast.

The Lumber River in the Lumberton, N. C., area continued in flood from January 30 to April 17. It was about 2 feet above flood stage in the beginning of April and was falling slowly from the severe flood of the previous month.

The Little Pee Dee River at Galivants Ferry, S. C., was slightly above flood stage in the beginning of the month. It fell slowly within its banks on April 13 after having been in flood since March 2, a period of 43 days. Minor flooding occurred on the Pee Dee River at Peedee, S. C., on April 2-3. The North Fork of the Edisto at Orangeburg, S. C., which rose above flood stage on March 28, receded within its banks on April 1. The Edisto River at Givhans, S. C., continued in flood from March 29 to April 10.

Minor flooding occurred in Georgia during the first half of April. The Savannah River at Clyo, Ga., was receding from a crest of 8 feet flood stage on March 14. A secondary crest, 5 feet lower, occurred on April 6-7. No significant damage occurred from the flooding on the Ogeechee, Oconee, and Altamaha Rivers.

EAST GULF OF MEXICO DRAINAGE

Heavy rains (1 to 2 inches) on the 23d-24th caused flash flooding on small streams in the Chattahoochee Basin. Peachtree Creek at Atlanta, Ga., reached a crest slightly more than 3 feet above flood stage for a brief period on the 23d. The minor flooding on the Flint and Apalachicola Rivers was due to heavy rains on March 25-26.

The Choctawhatchee River at Caryville, Fla., was in recession but slightly above flood stage on April 1. Additional rains of 1 to 2 inches on the 5th-6th caused an additional rise, with minor flooding on the 6th-9th. The flooding on the Conecuh and Alabama Rivers in Alabama was due to heavy rains during the latter part of March.

Moderate rains on the 21st-23d caused minor flooding on the East Fork Tombigbee River at Fulton, Miss.,

on the 24th-27th. No damage resulted from this overflow.

The widespread lowland flooding along the Pearl River at Jackson, Miss., and the lower portion in Louisiana during the first half of April was due to heavy rains during March. Heavy showers on April 20 caused minor overflow at Jackson, Miss., on the 22d-24th and at Bogalusa, La., on the 26th-30th. All areas adjacent to the rivers remained too wet for timber cutting and agricultural operations during the entire month.

MISSISSIPPI SYSTEM

Upper Mississippi Basin--Precipitation during April in the Upper Mississippi Basin was much below normal for the second consecutive month. The precipitation that did occur (1 to 1.25 inches) fell in small amounts with more than one-half of the total occurring on April 27-28, which was well after the crests occurred.

The temperature pattern during April was favorable for slow and orderly runoff. The month began cold with below freezing temperatures on April 1-7, 13-14, and 21-24. Temperatures on the days in between were in the fifties or higher with nighttime lows above 32°.

The spring snowmelt in Minnesota and Wisconsin produced overflows which were generally less than 2 feet above flood stage.

Snowmelt flooding on streams in Iowa during April was minor. Crests on the East Fork Des Moines at Burt, Iowa, and on the North Raccoon at Jefferson, Iowa, were reached on March 17 and March 30. The Shell Rock and Cedar Rivers reached minor crests on April 1-2.

The main stem of the Mississippi crested between April 14 and April 29. Crests were generally less than 2 feet above flood stage.

Missouri Basin--Heavy rains in the Bozeman and Bridger Mountain area caused the East Gallatin River in Montana to overflow its banks on the 24th-25th. Much silt was carried by the river and a few homes along its banks were briefly evacuated. The river reached a maximum flow of 2,050 c.f.s. on the morning of the 25th, which was the highest flow reached since 1953.

Minor flooding occurred during the last week of April on small creeks in Boulder County, Colo. The lower South Platte River rose to near flood stage at some points as the water moved downstream.

Moderate snowmelt during March caused the Little Sioux River in western Iowa to reach 1 foot to 3 feet above flood stage over the upper reaches on March 30 to April 1. Lowland flooding resulted in minor damage with no property losses.

Arkansas Basin--Heavy rain up to 9.25 inches in Bedrock Creek Basin in north-central Oklahoma on the 27th-28th caused an area of flooding 1 mile wide and 15 miles long. The water was 1-1/2 to 2 feet deep over the flood plain. As much as 4.5 inches of rain occurred in 2 to 4 hours. Damage to crops was estimated at $300,000. Partial damage to crops was from hail.

GREAT BASIN

Minor snowmelt flooding occurred on the lower Blacksmith Fork in northern Utah and in the upper Bear River on April 30 and May 1. Precipitation during April was above normal through northern Nevada, Wyoming, and the northern mountains of Utah and below normal in southern Utah and southern Colorado.

PACIFIC SLOPE DRAINAGE

Sacramento Basin--Heavy precipitation during the last of March caused rises along the Sacramento River on April 1-4. Minor overflow occurred at Tisdale Weir into the Sutter By-Pass.

Columbia Basin--Heavy rains on the 22d-24th over the middle and upper Snake River Basin increased streamflow on the Portneuf at Pocatello, Idaho, and Henrys Fork near Rexburg, Idaho. Willow and Sand Creeks, east of Idaho Falls, rose to bankfull stages but did not overflow.

Heavy precipitation between the 8th and the 11th in the northern Willamette Basin caused the Pudding River at Aurora, Oreg., to exceed flood stage by 1 foot on the 10th-13th. The Corps of Engineers estimated damages at $1,100. Uncontrolled streams in the Willamette Basin responded to the heavy rains with the flow in the Willamette at Salem, Oreg., increasing from 26,000 c.f.s. on the 8th to a peak flow of 61,000 c.f.s. on the 11th. In the local Portland area, Johnson Creek at Sycamore, Oreg., rose from 30 c.f.s. on the 8th to a peak flow of 620 c.f.s. (6.8 feet) on the 9th. Bankfull stage at Sycamore is 7 feet.

floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G.c.t.

lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun.

M Moderate haze - indeterminable
* Values corresponding to true solar noon

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol 8, No 2, page 63, of this publication

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys. APRIL 1971

Station	Day of month

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska. APRIL 1971

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	-40	12	2	20	113	2	13	53	106	41	23	-3	86	-1	-25	121	162	171	153	188	207	124	117	68	69	181	185	162	117	145		86

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (λ 3900 Å) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	8.42	13.26	19.18	19.29	15.86	18.23	17.99	13.02	19.41	17.99	11.48	9.47	19.18	18.35	17.87	11.72	19.06	9.35	14.32	13.85	17.04	19.89	20.72	21.31	20.69	13.14	6.98	10.41	20.18	21.93		15.66

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code [illegible] defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

[illegible] total amount of ozone in the atmosphere, i.e., the amount contained in a vertical [illegible] ground level to the top of the atmosphere in the vicinity of the station. The amount of [illegible] is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure [illegible] code [illegible] designated for [illegible] data.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), April.

B. Temperature Departure from 30 - Year Mean (°F 1931-60), April 1971.

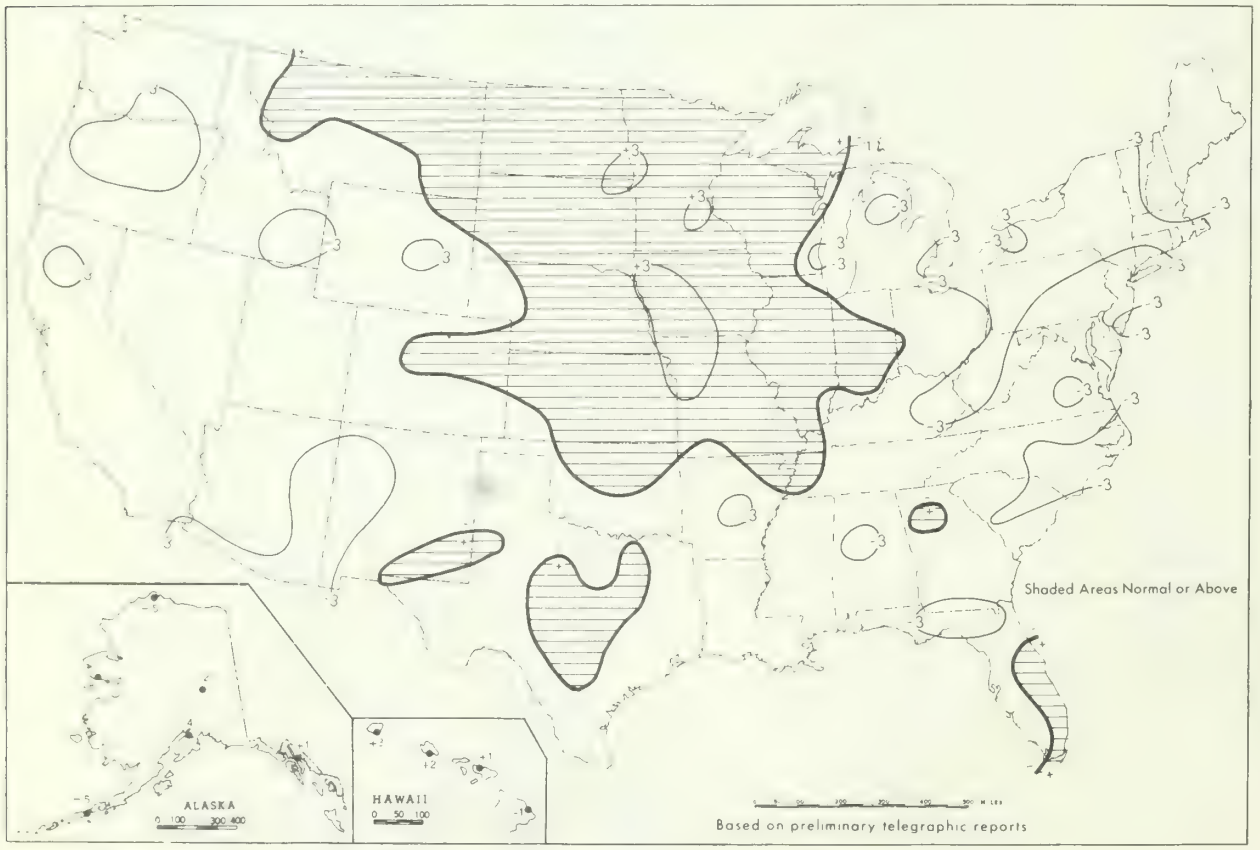

Chart II. Total Precipitation (Inches), April 1971.

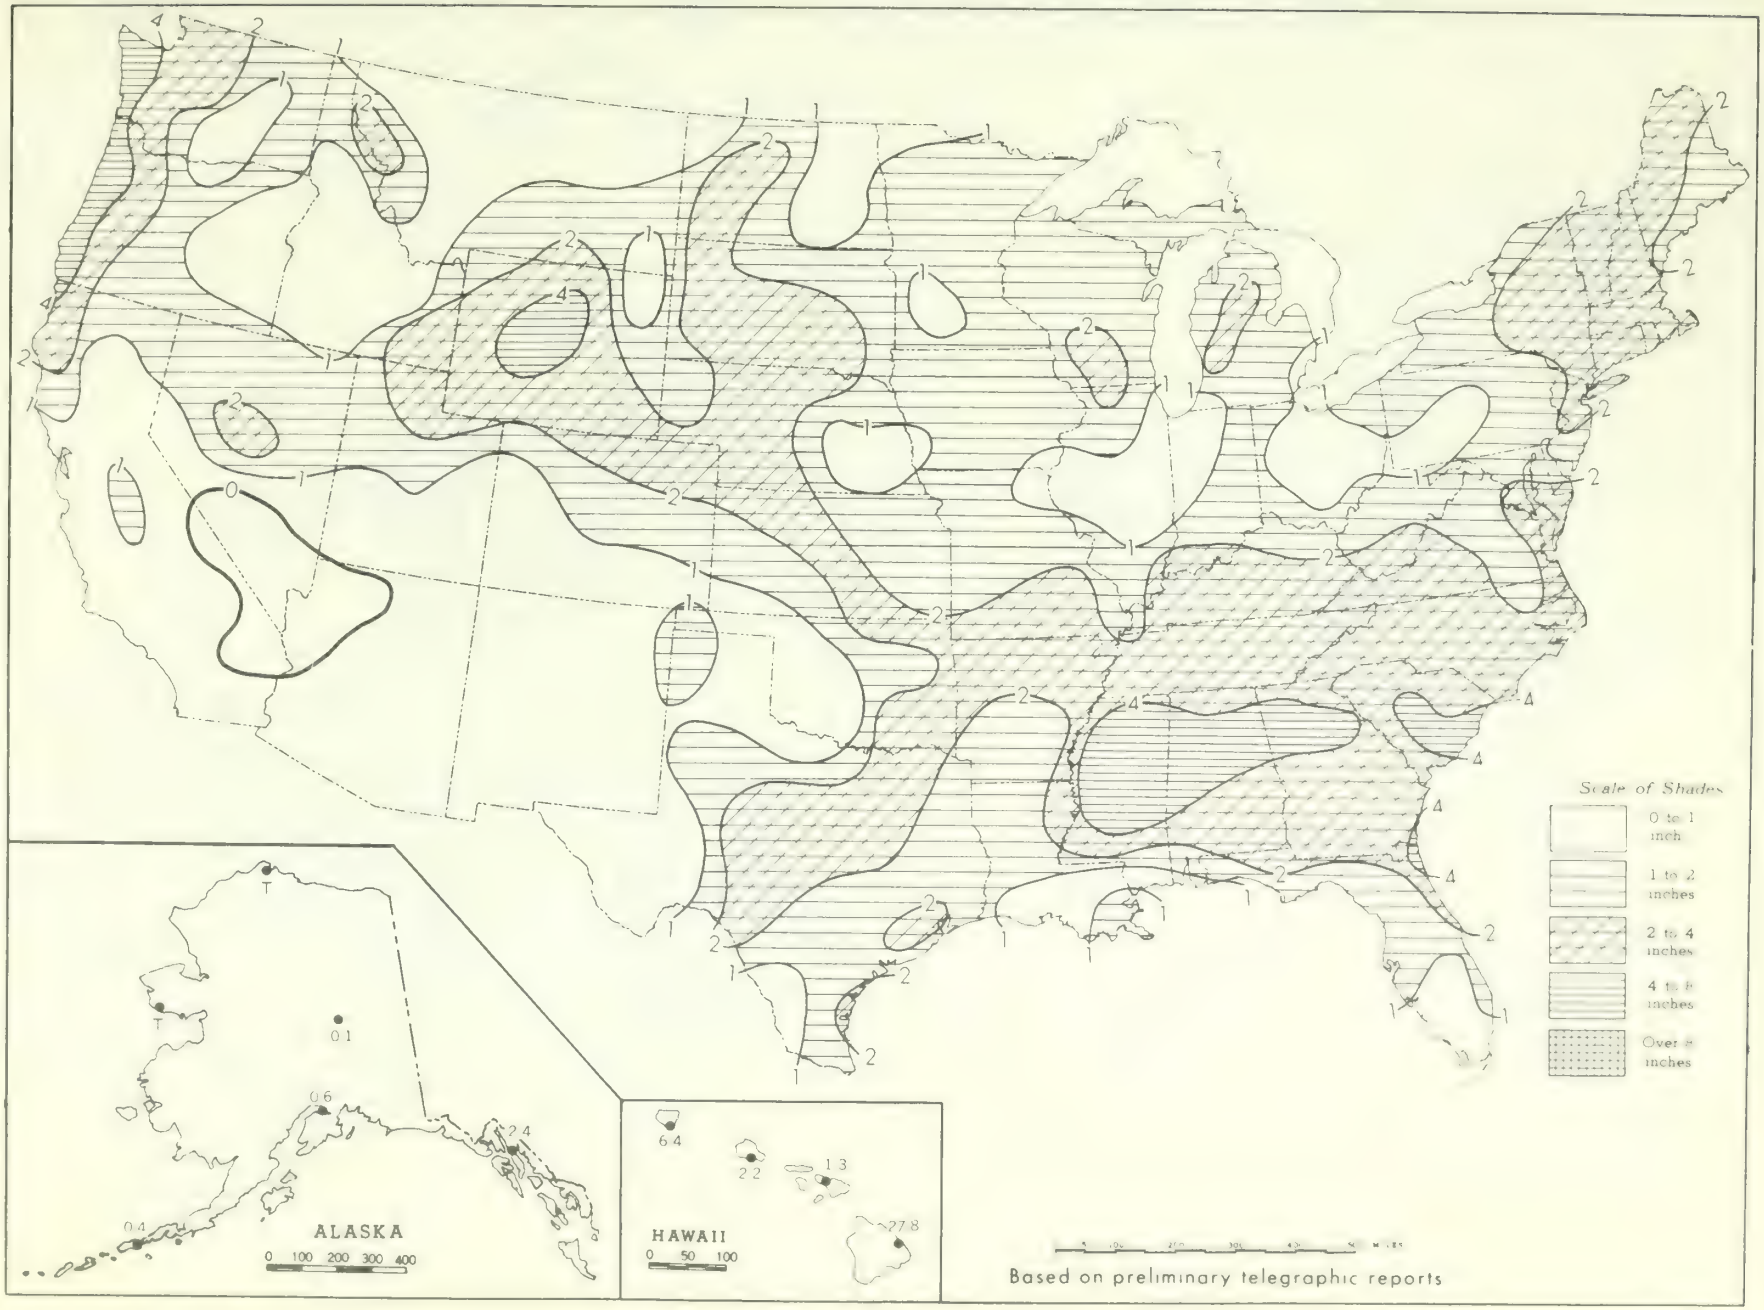

Chart III. Percentage of Normal Precipitation, April 1971.

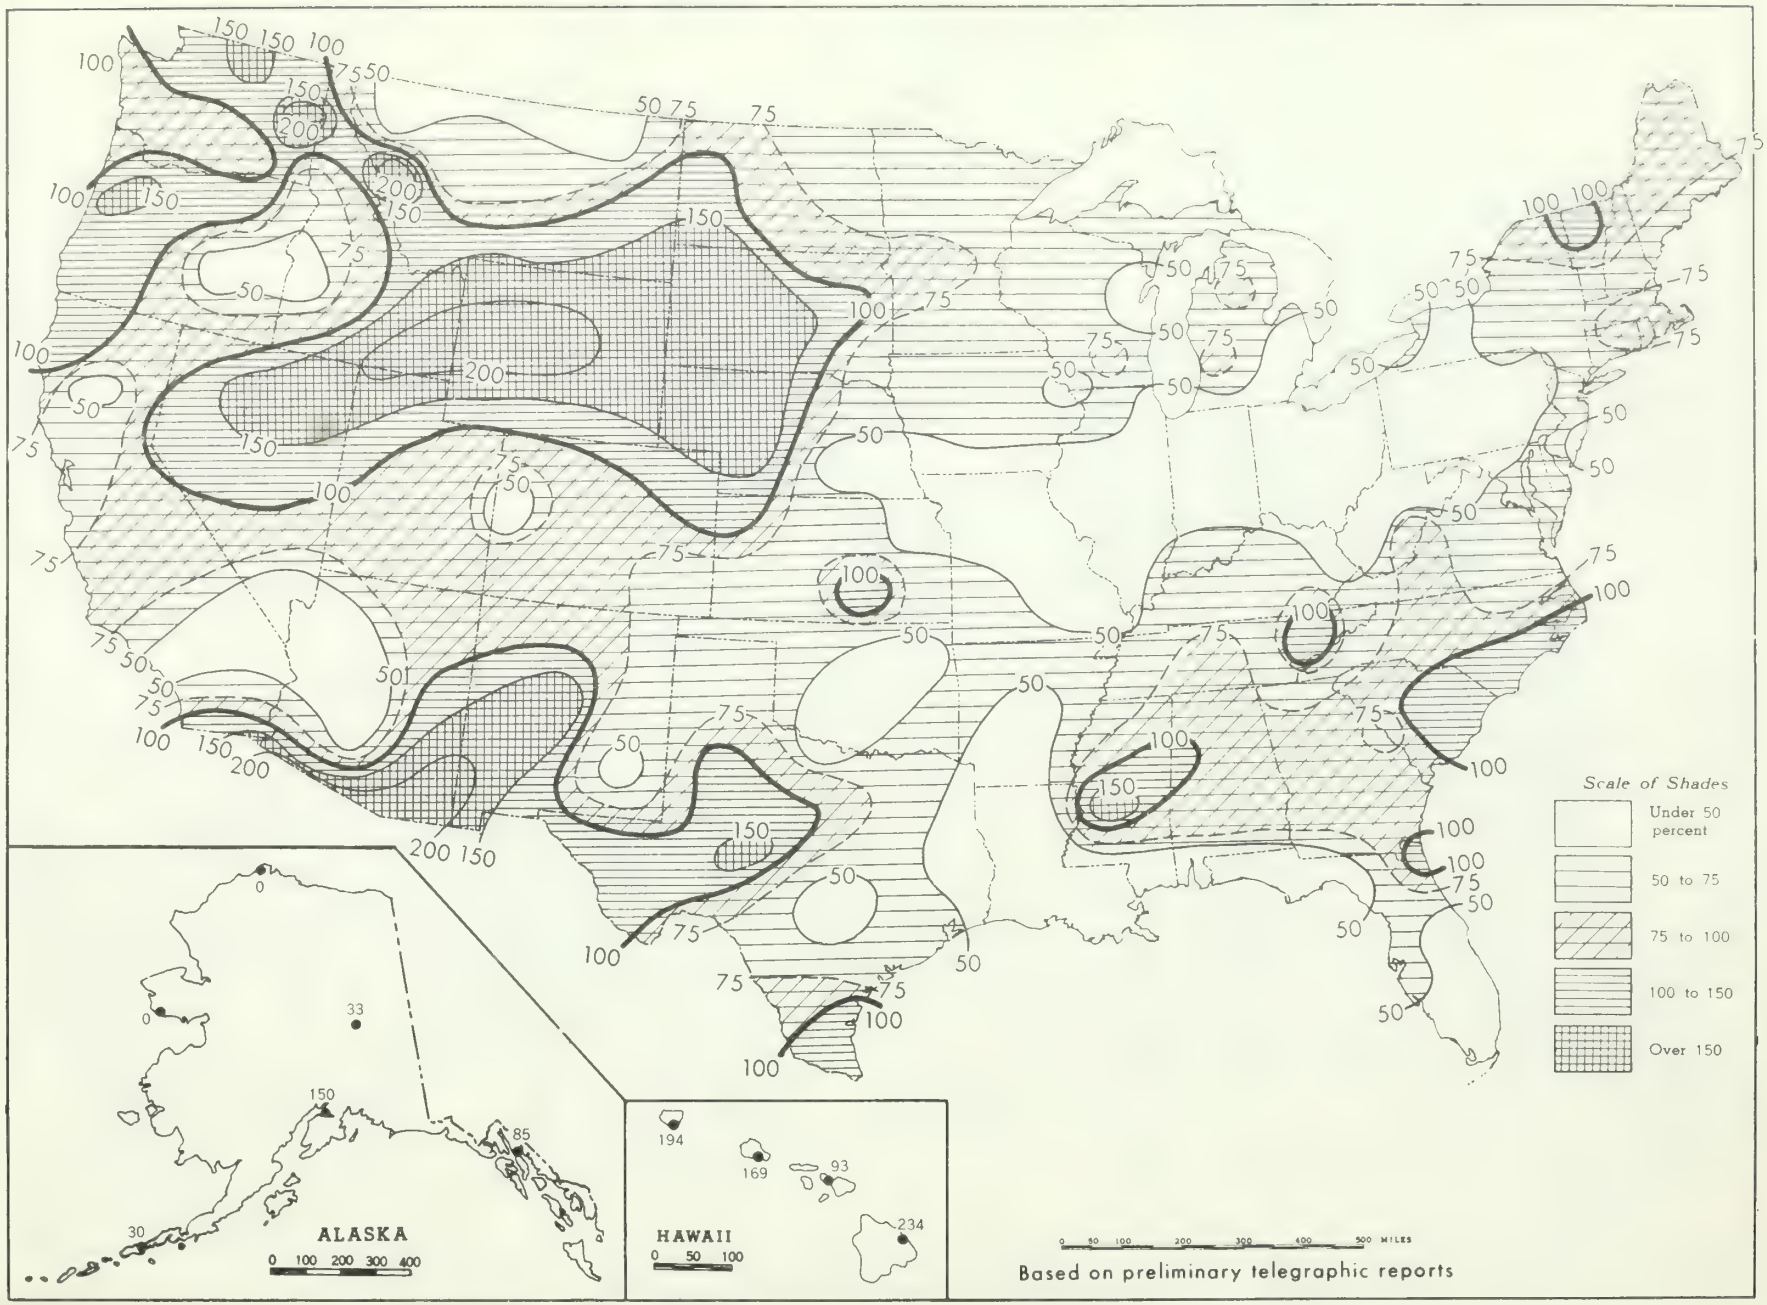

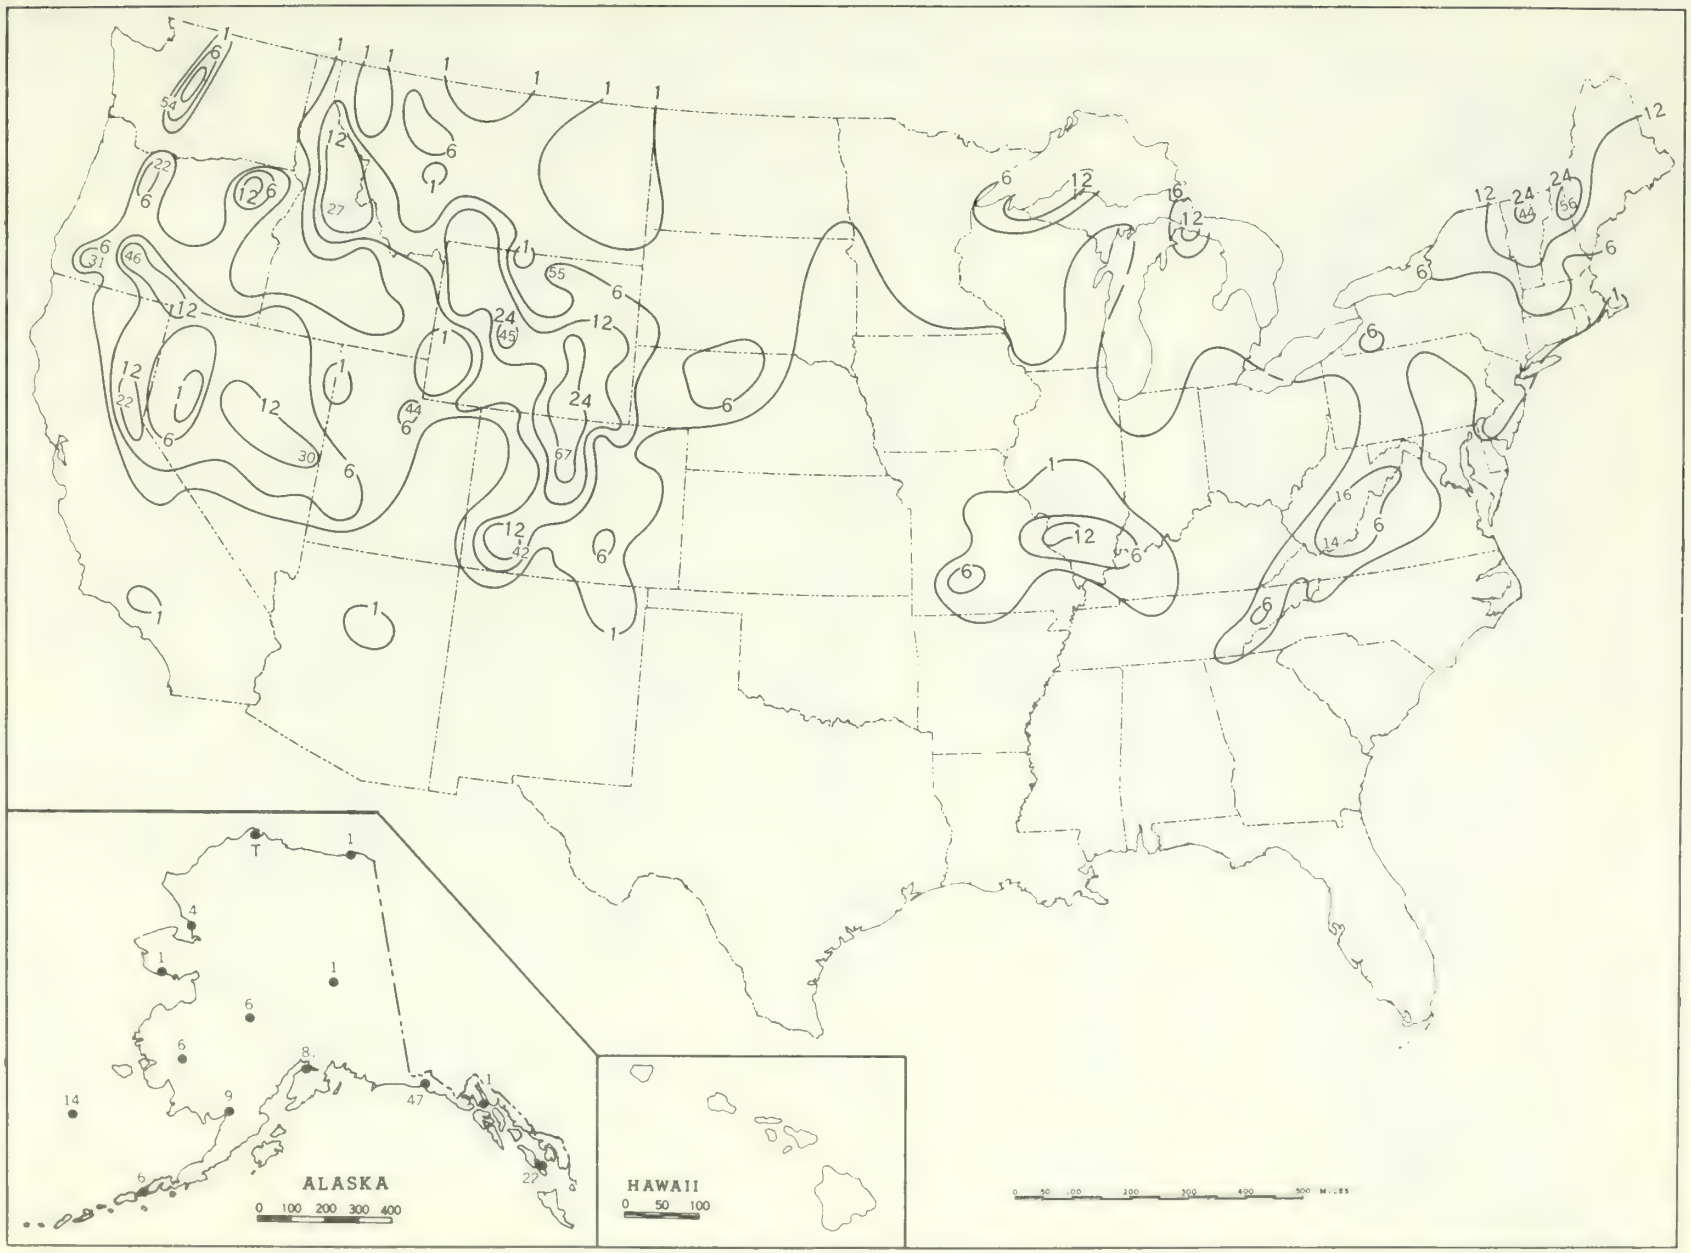

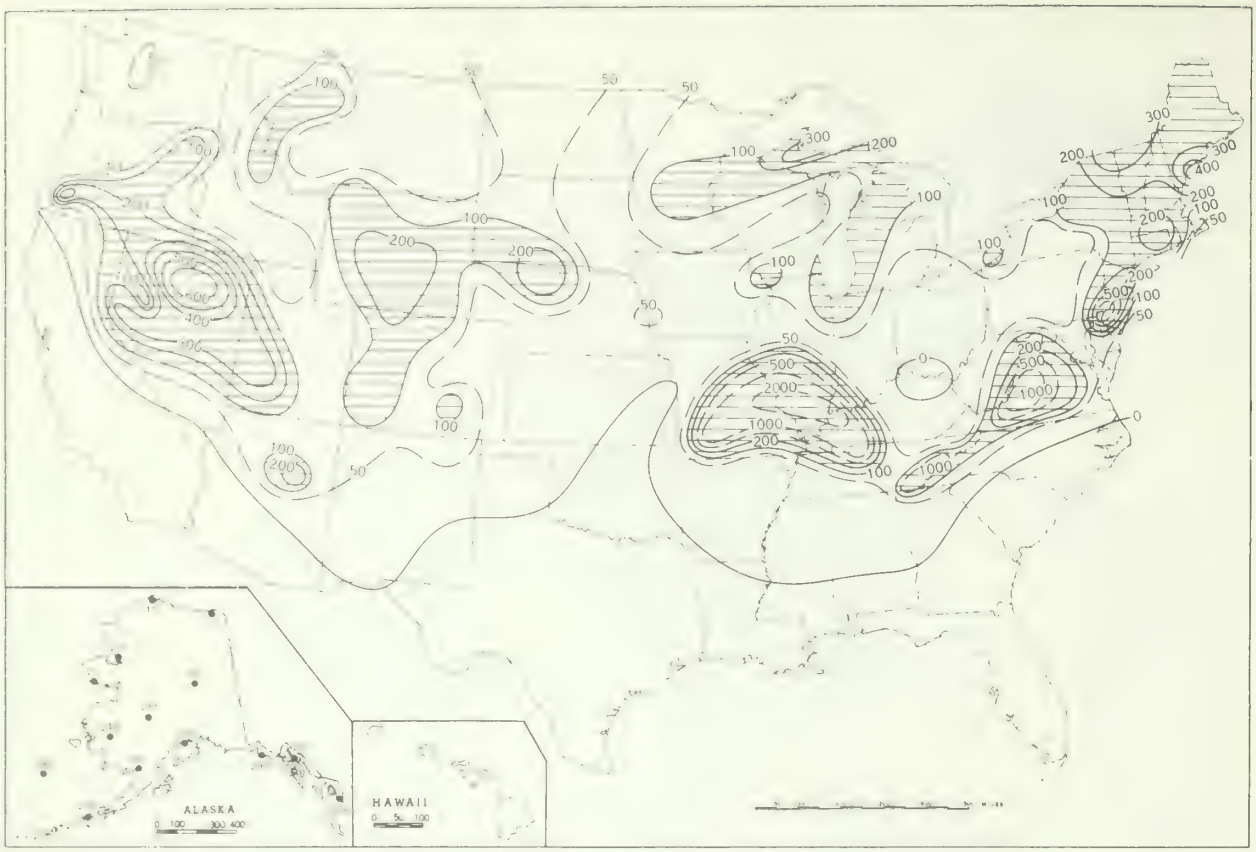

Chart IV. Total Snowfall (Inches), April 1971.

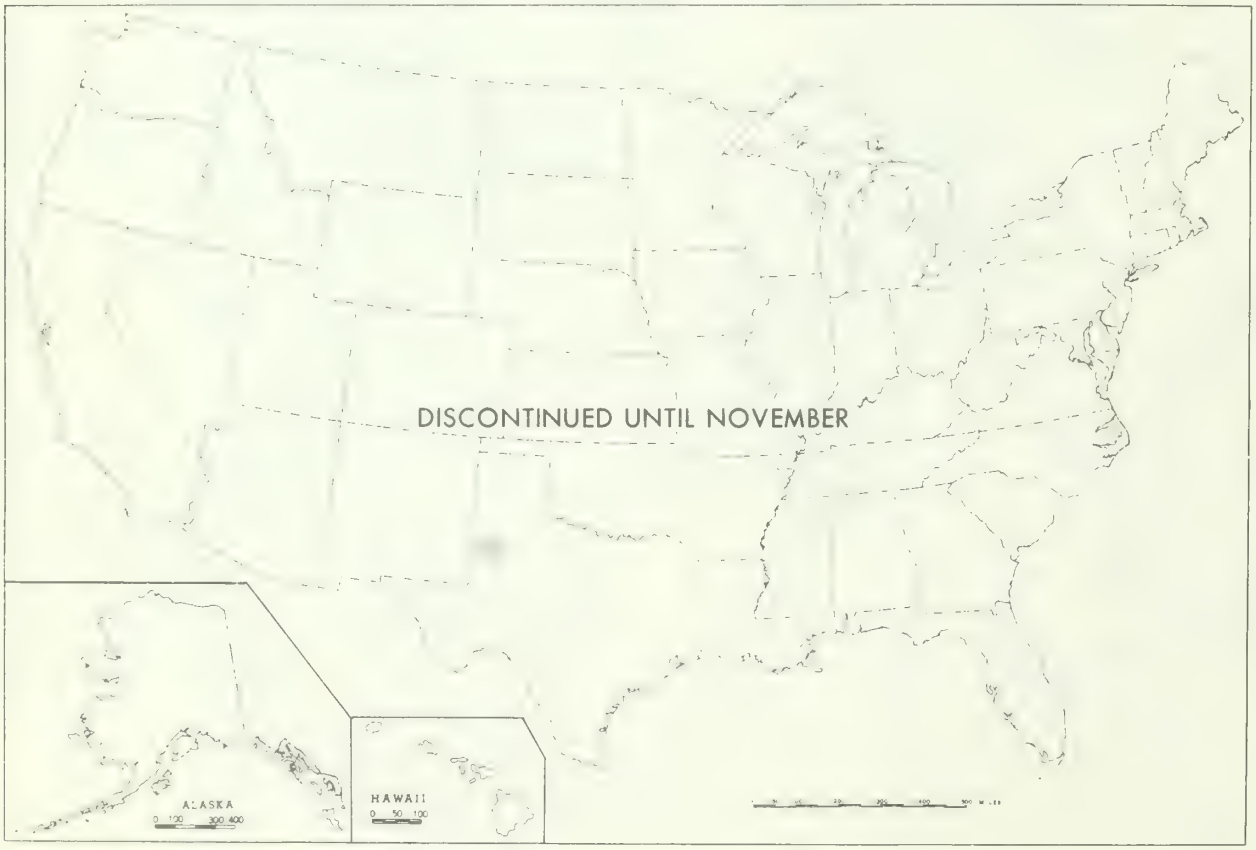
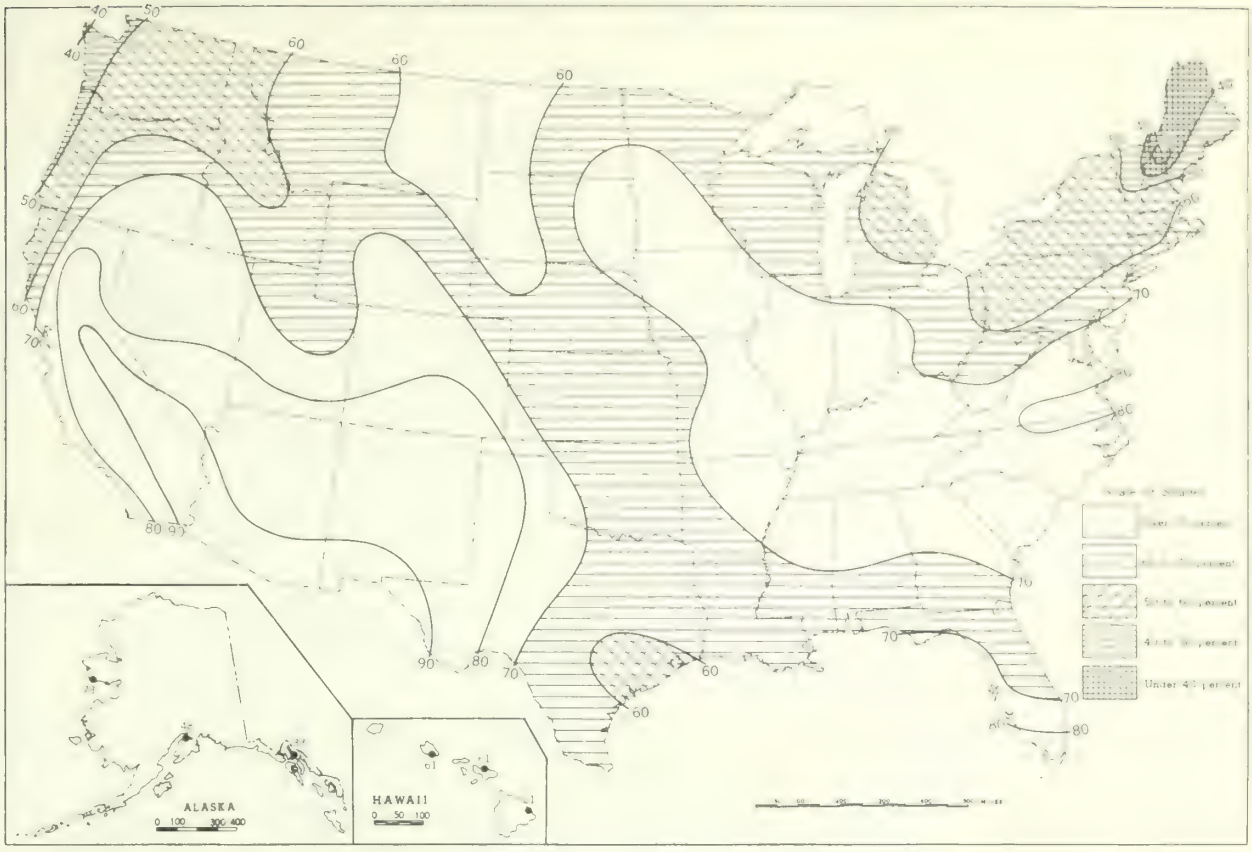
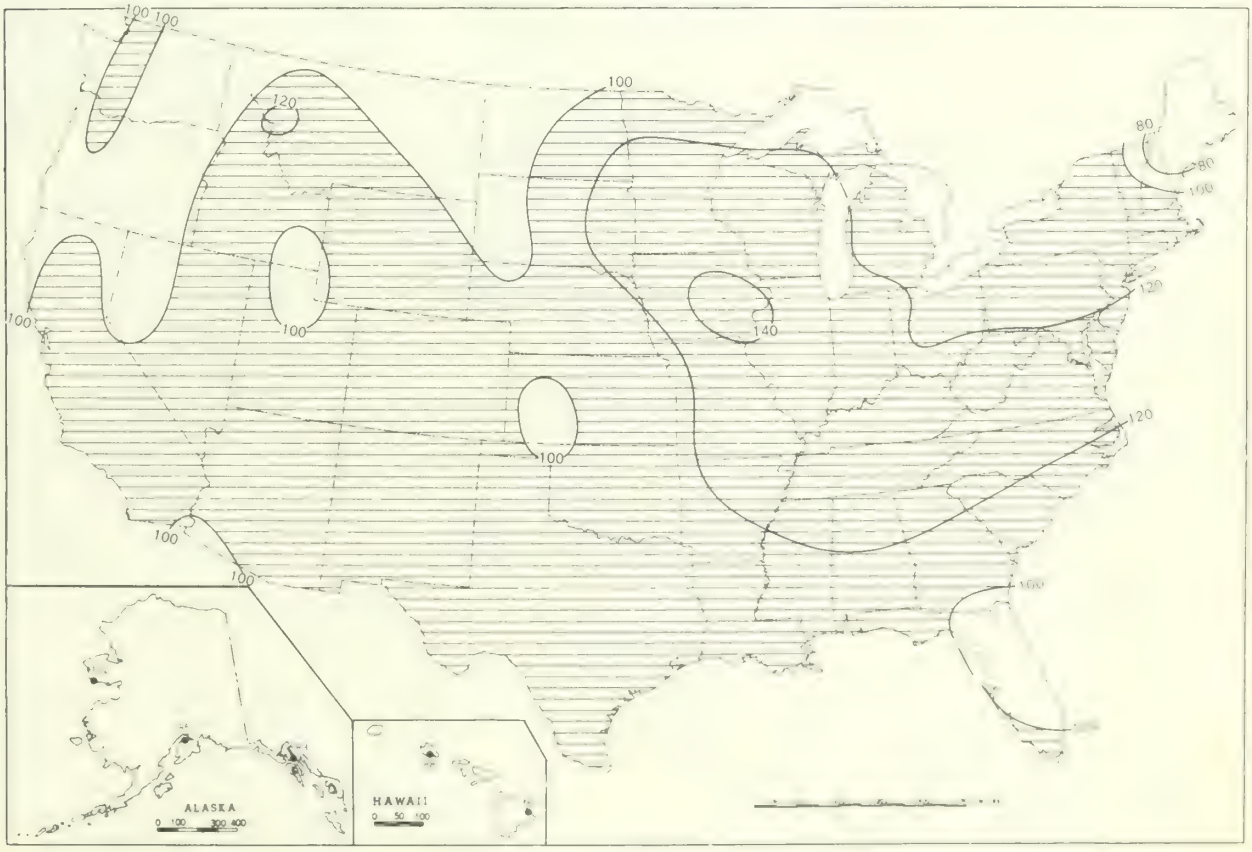
This is the total of unmelted snowfall recorded during the month at Weather Bureau and selected cooperative stations. This Chart and Chart V are published only for the months of November through April, although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year.

Chart V-A Percentage of Mean Monthly Snowfall, April 1971.

B. Depth of Snow on Ground (Inches), 7:00 a.m. e.s.t., April ,1971.







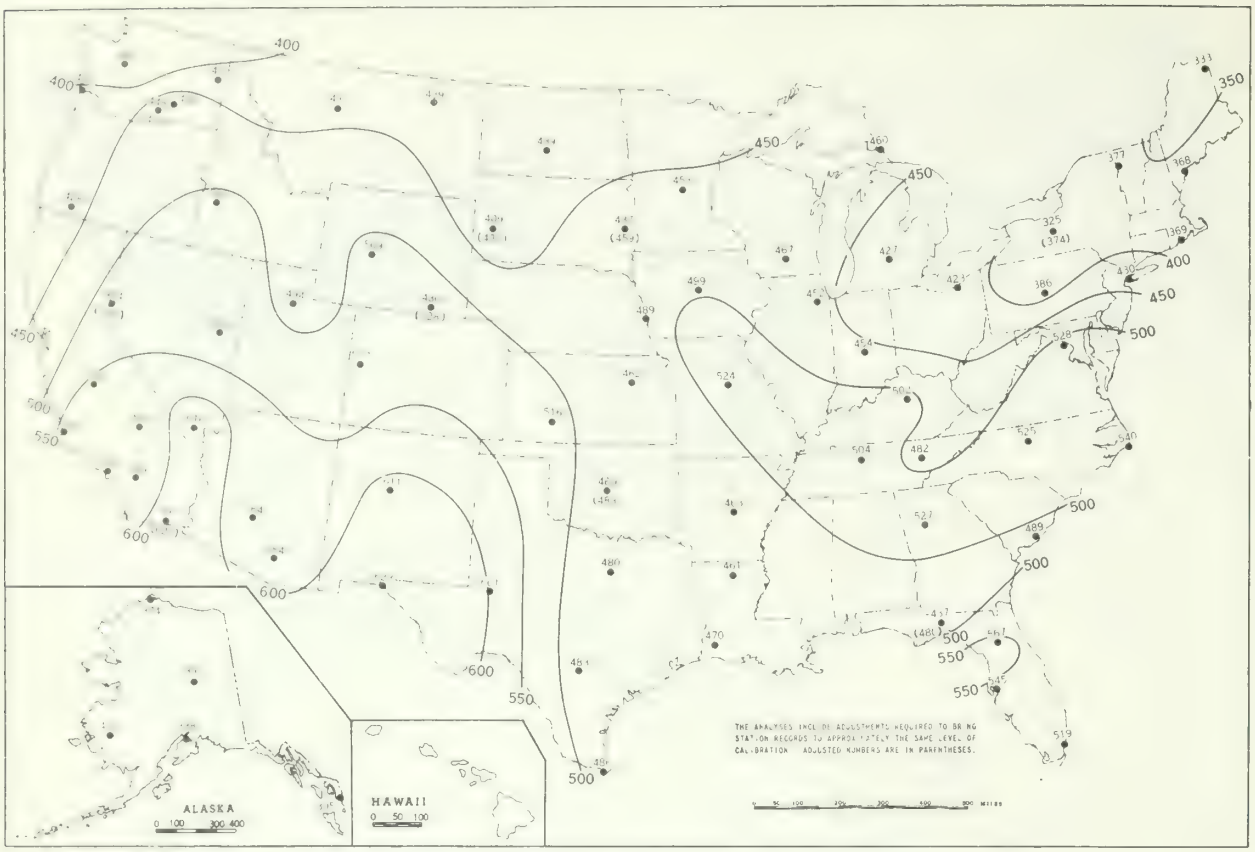


Chart VI. A. Percentage of Possible Sunshine, April 1971.

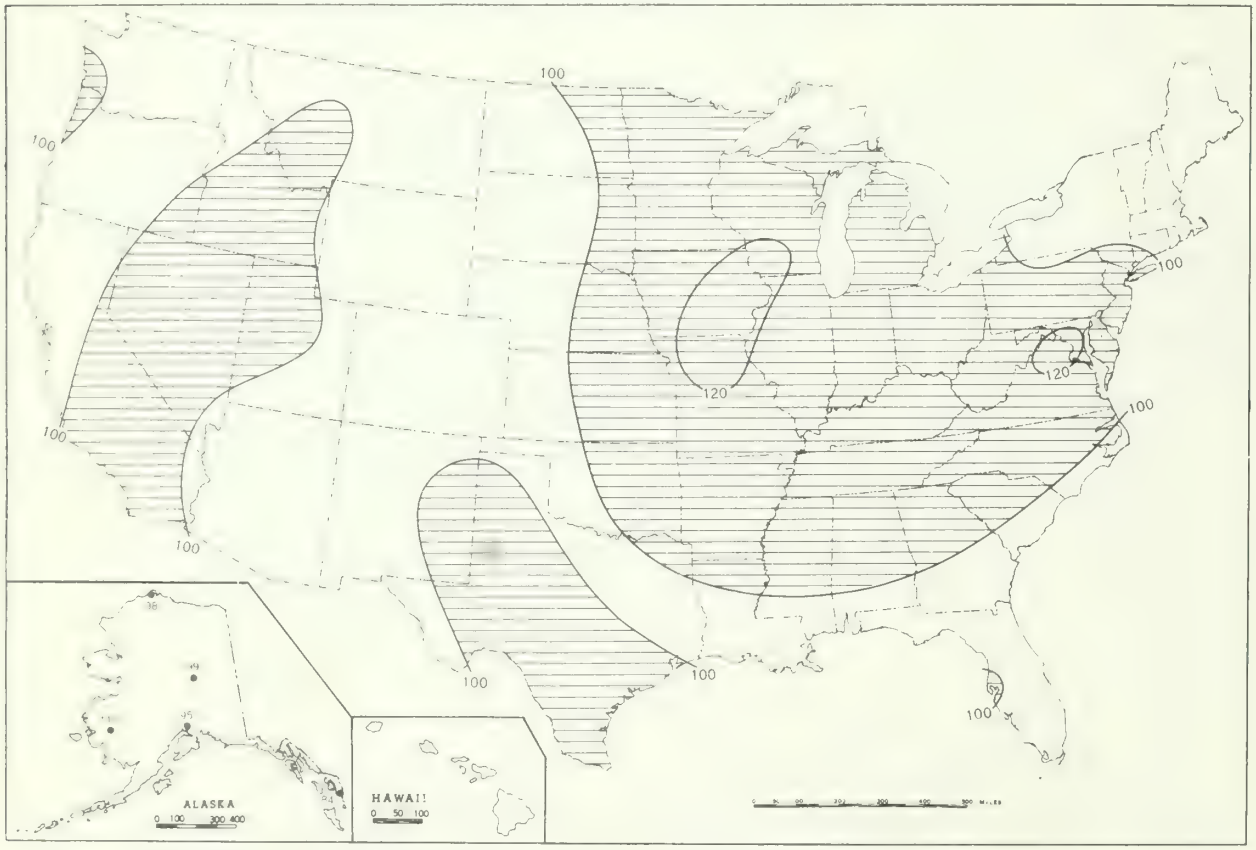
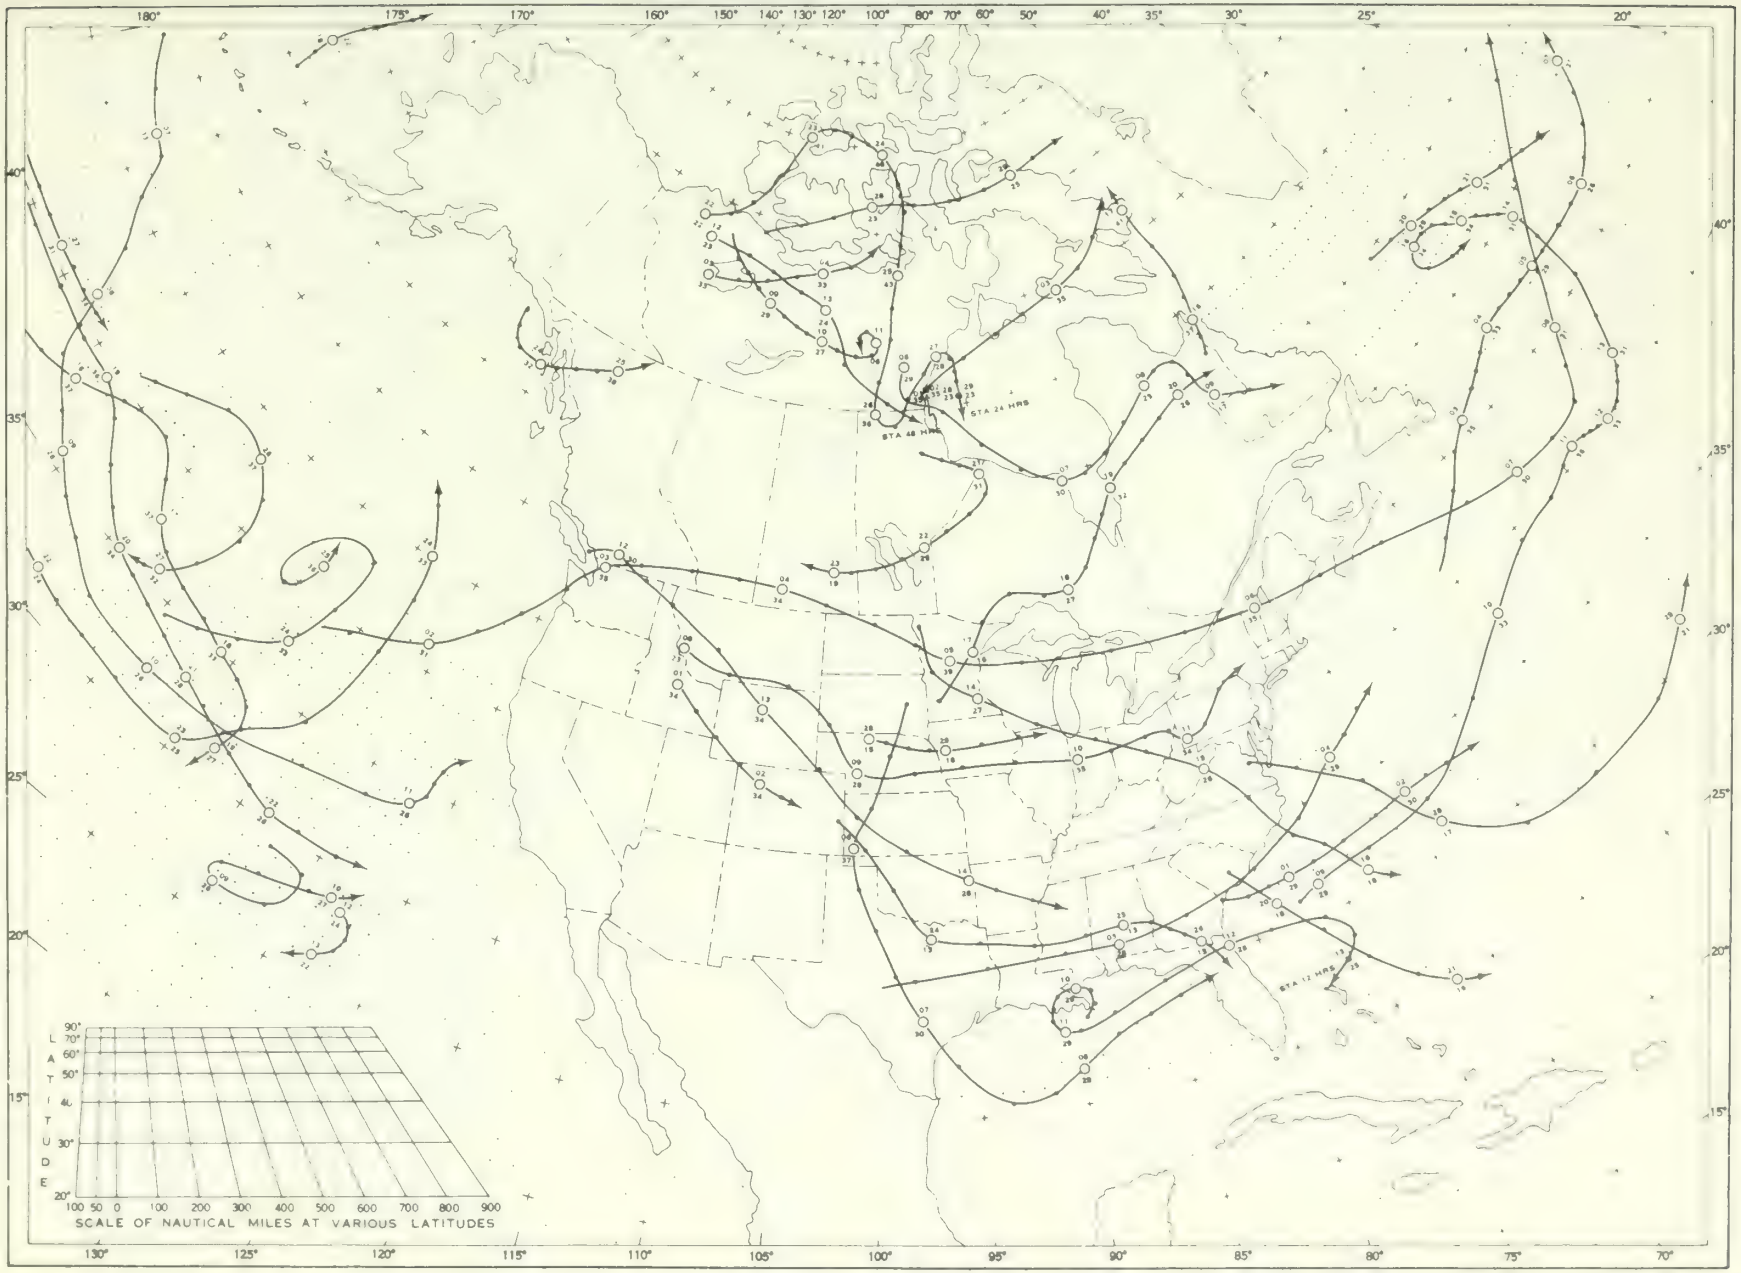
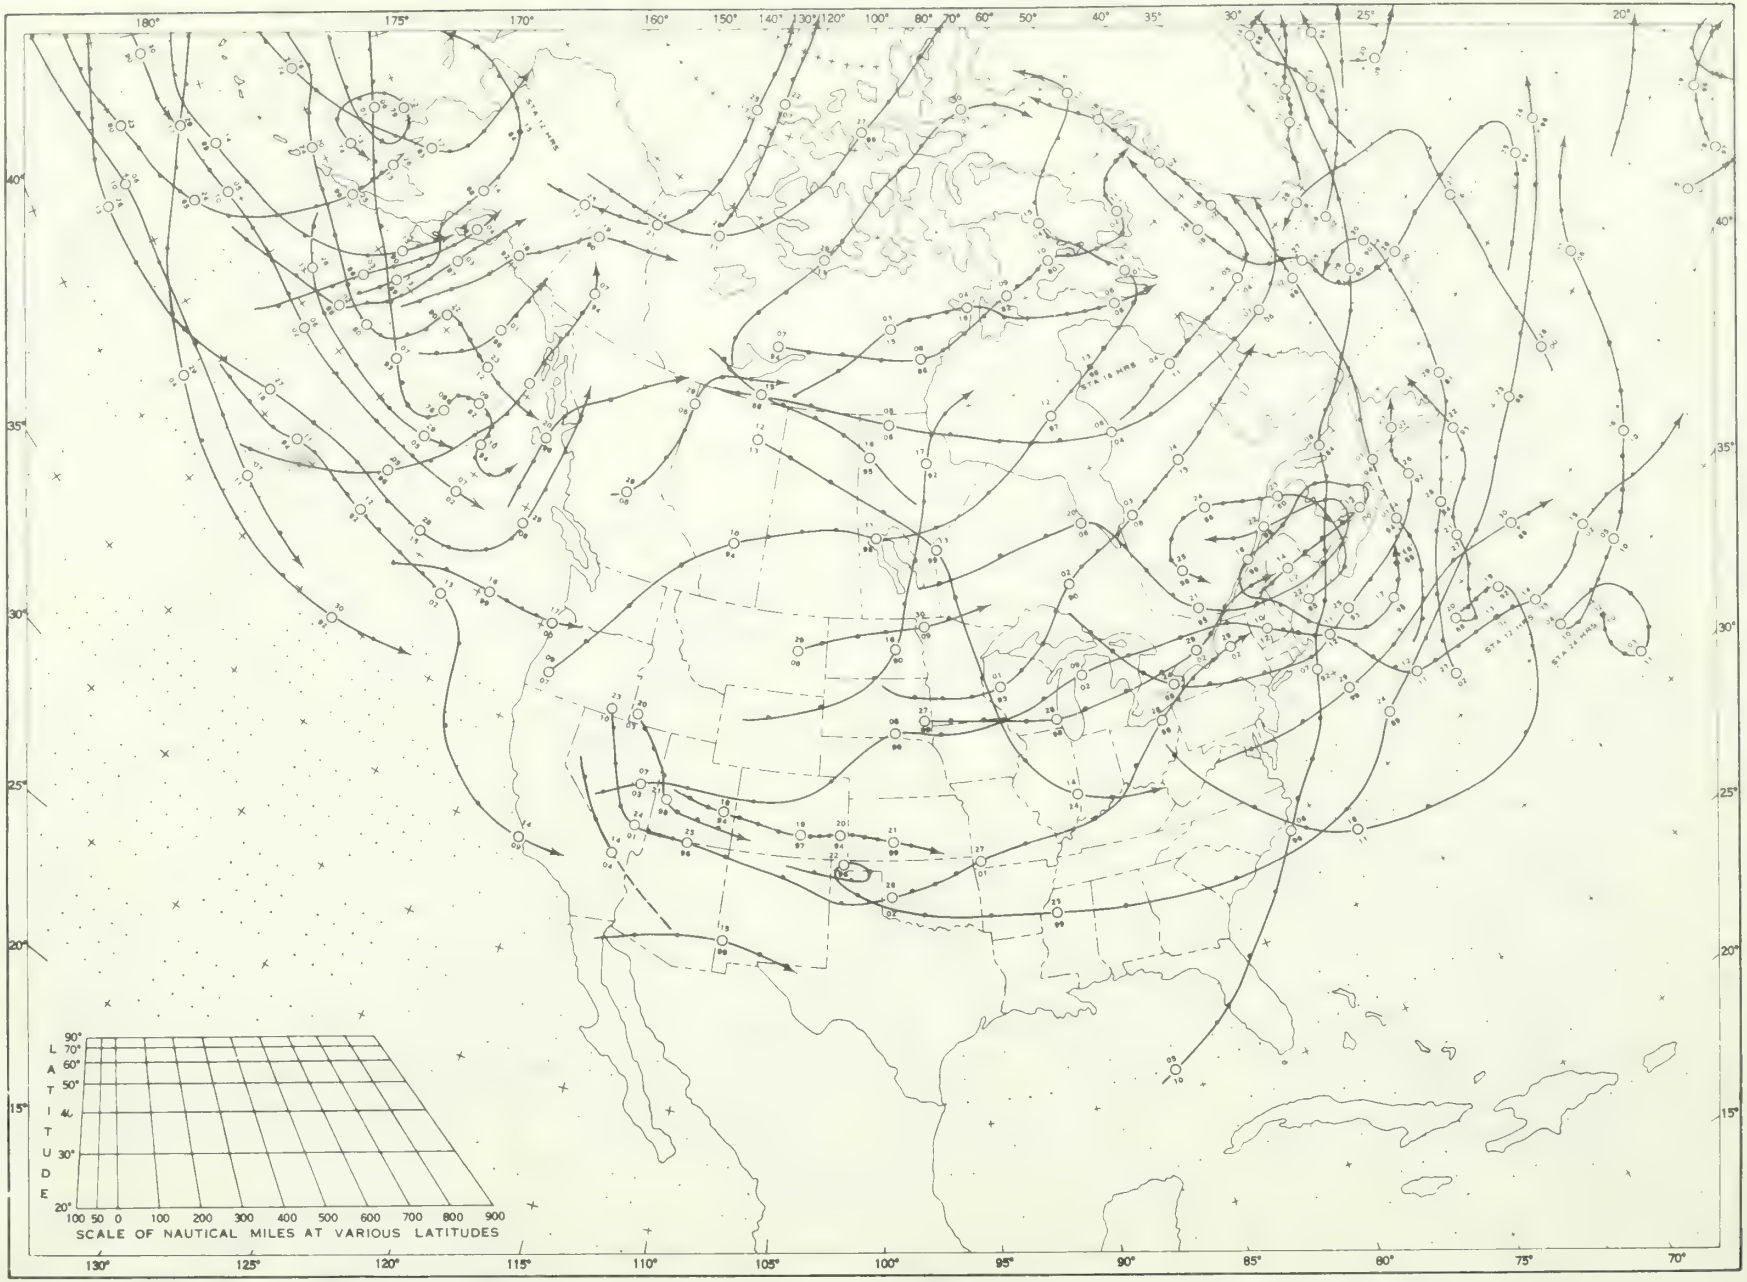


B. Percentage of Mean Monthly Sunshine, April 1971.

A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

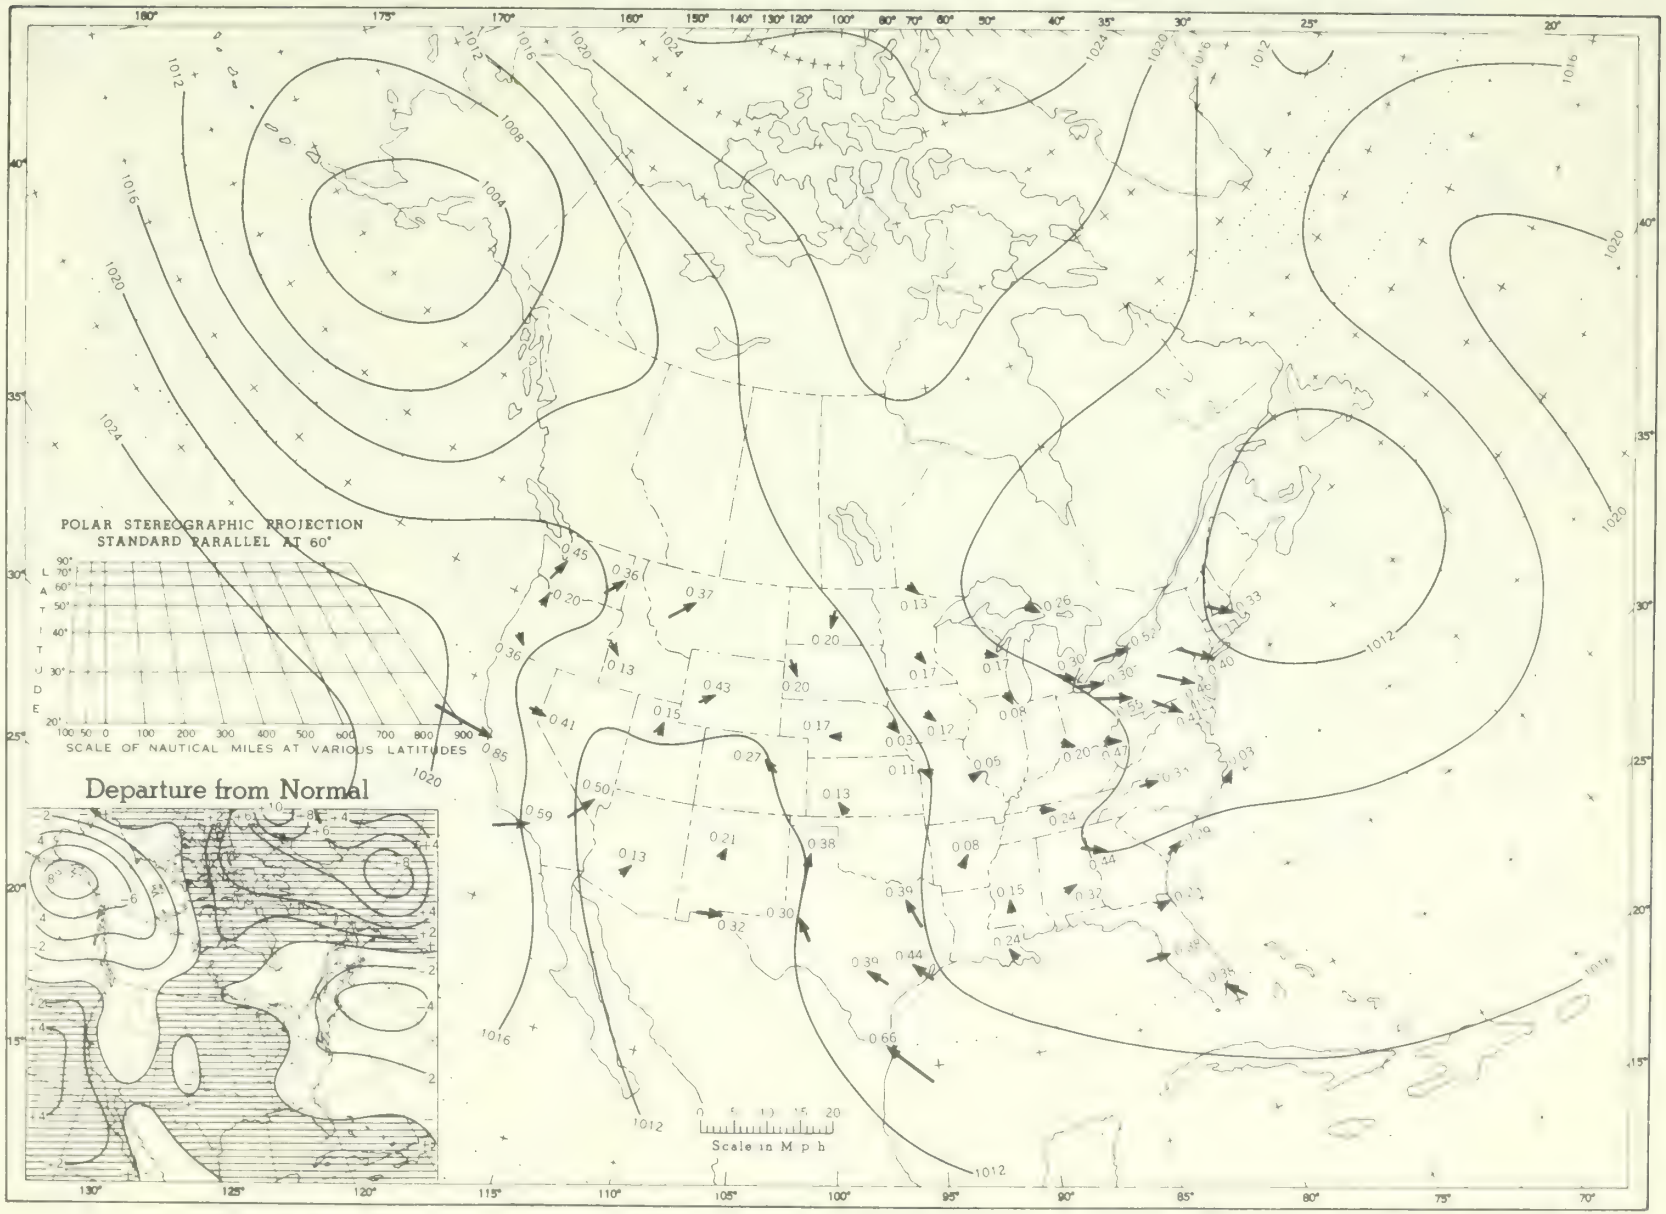


B. Percentage of Mean Daily Solar Radiation, April 1971.



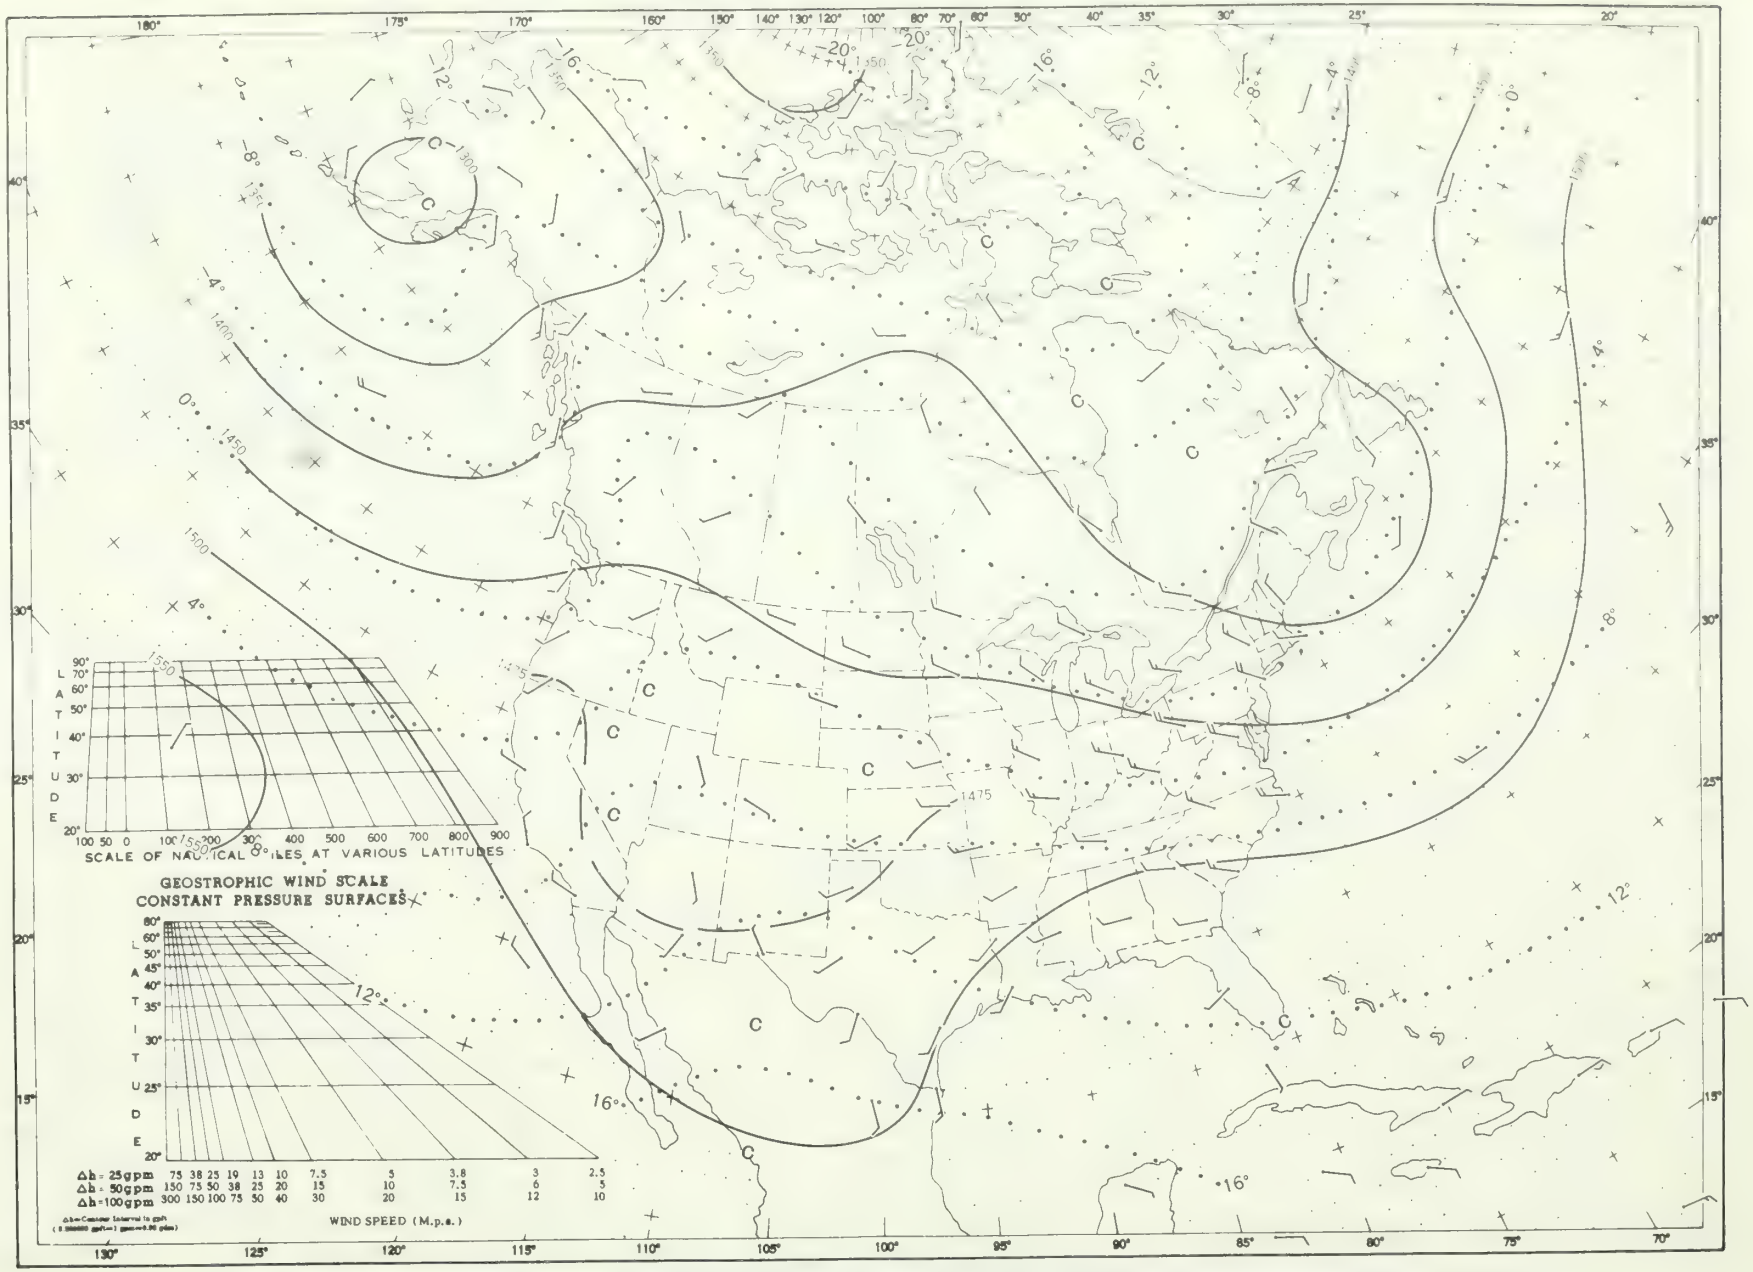
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, April 1971.



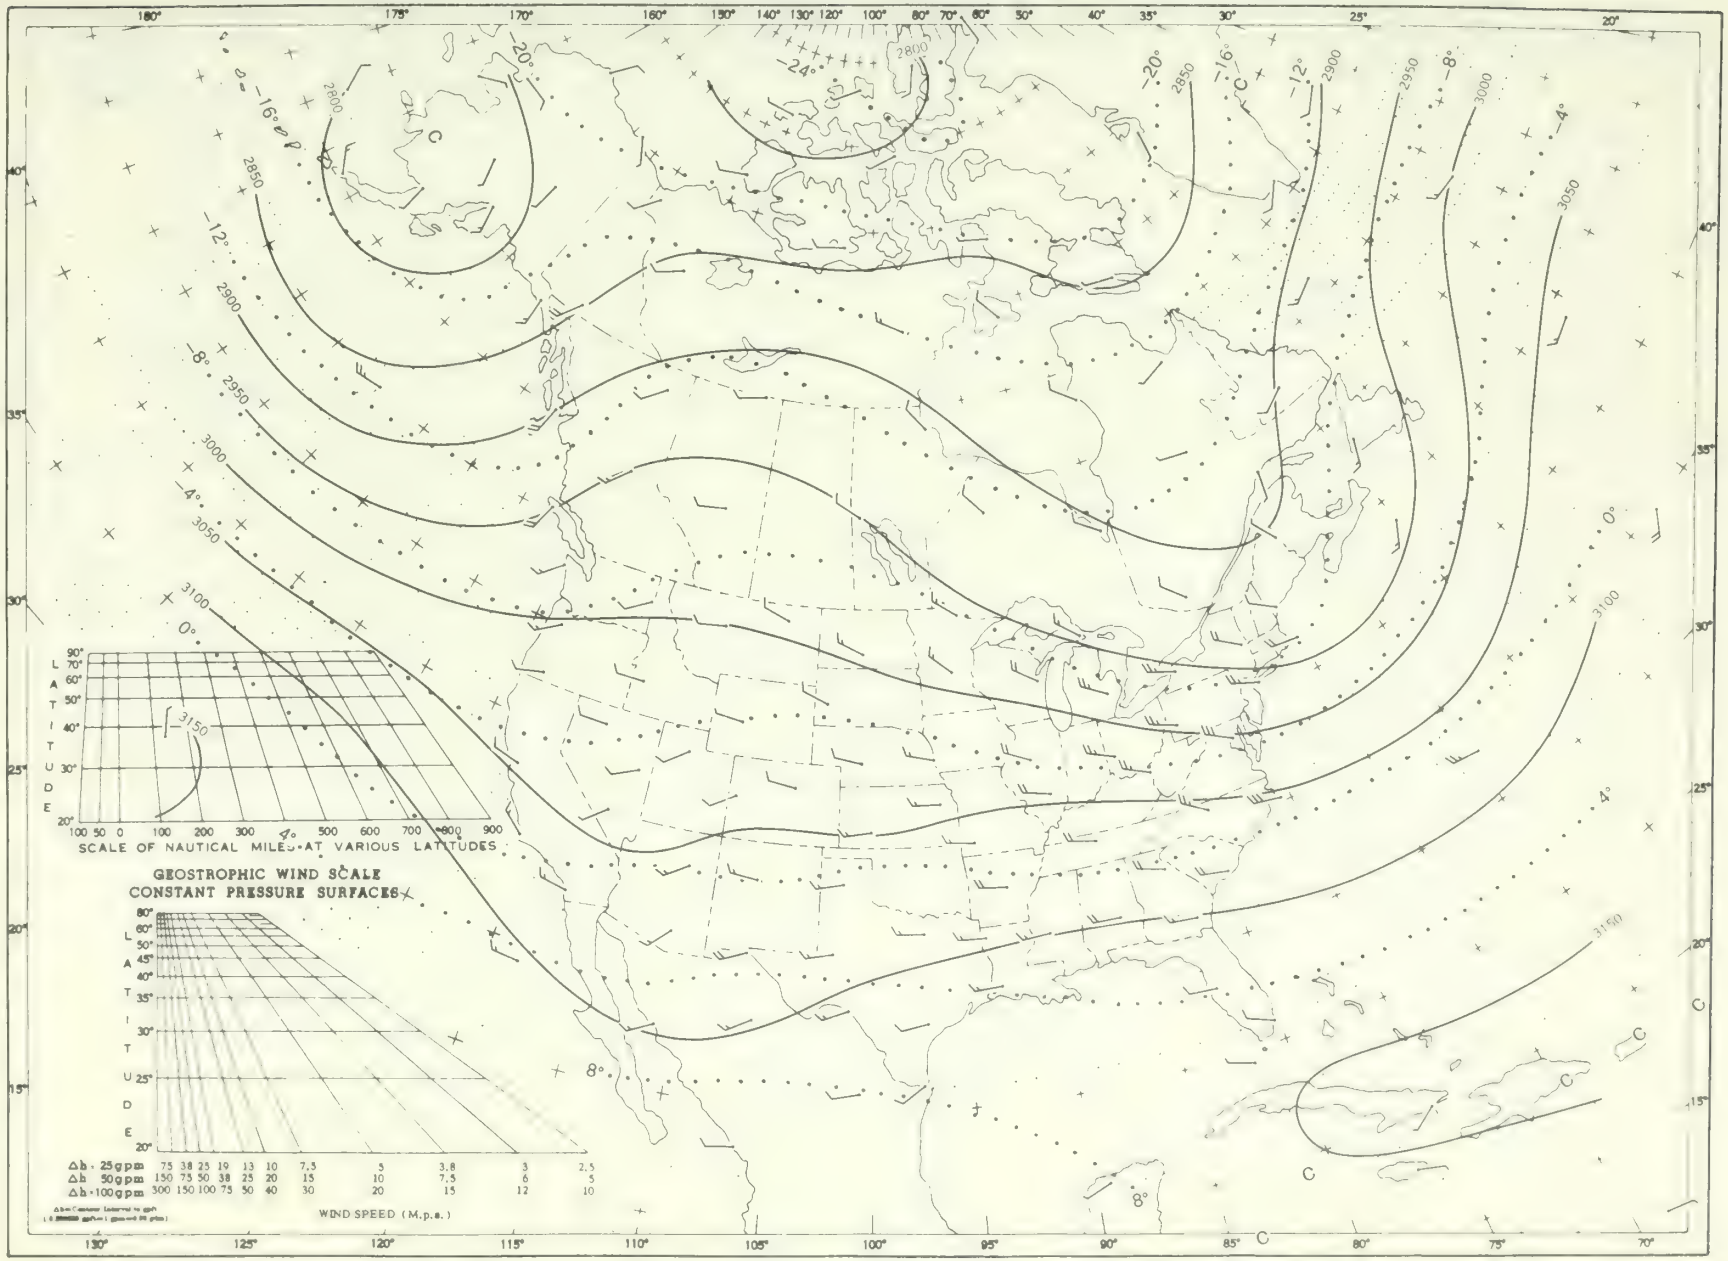
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX Tracks of Centers of Cyclones at Sea Level, April 1971.



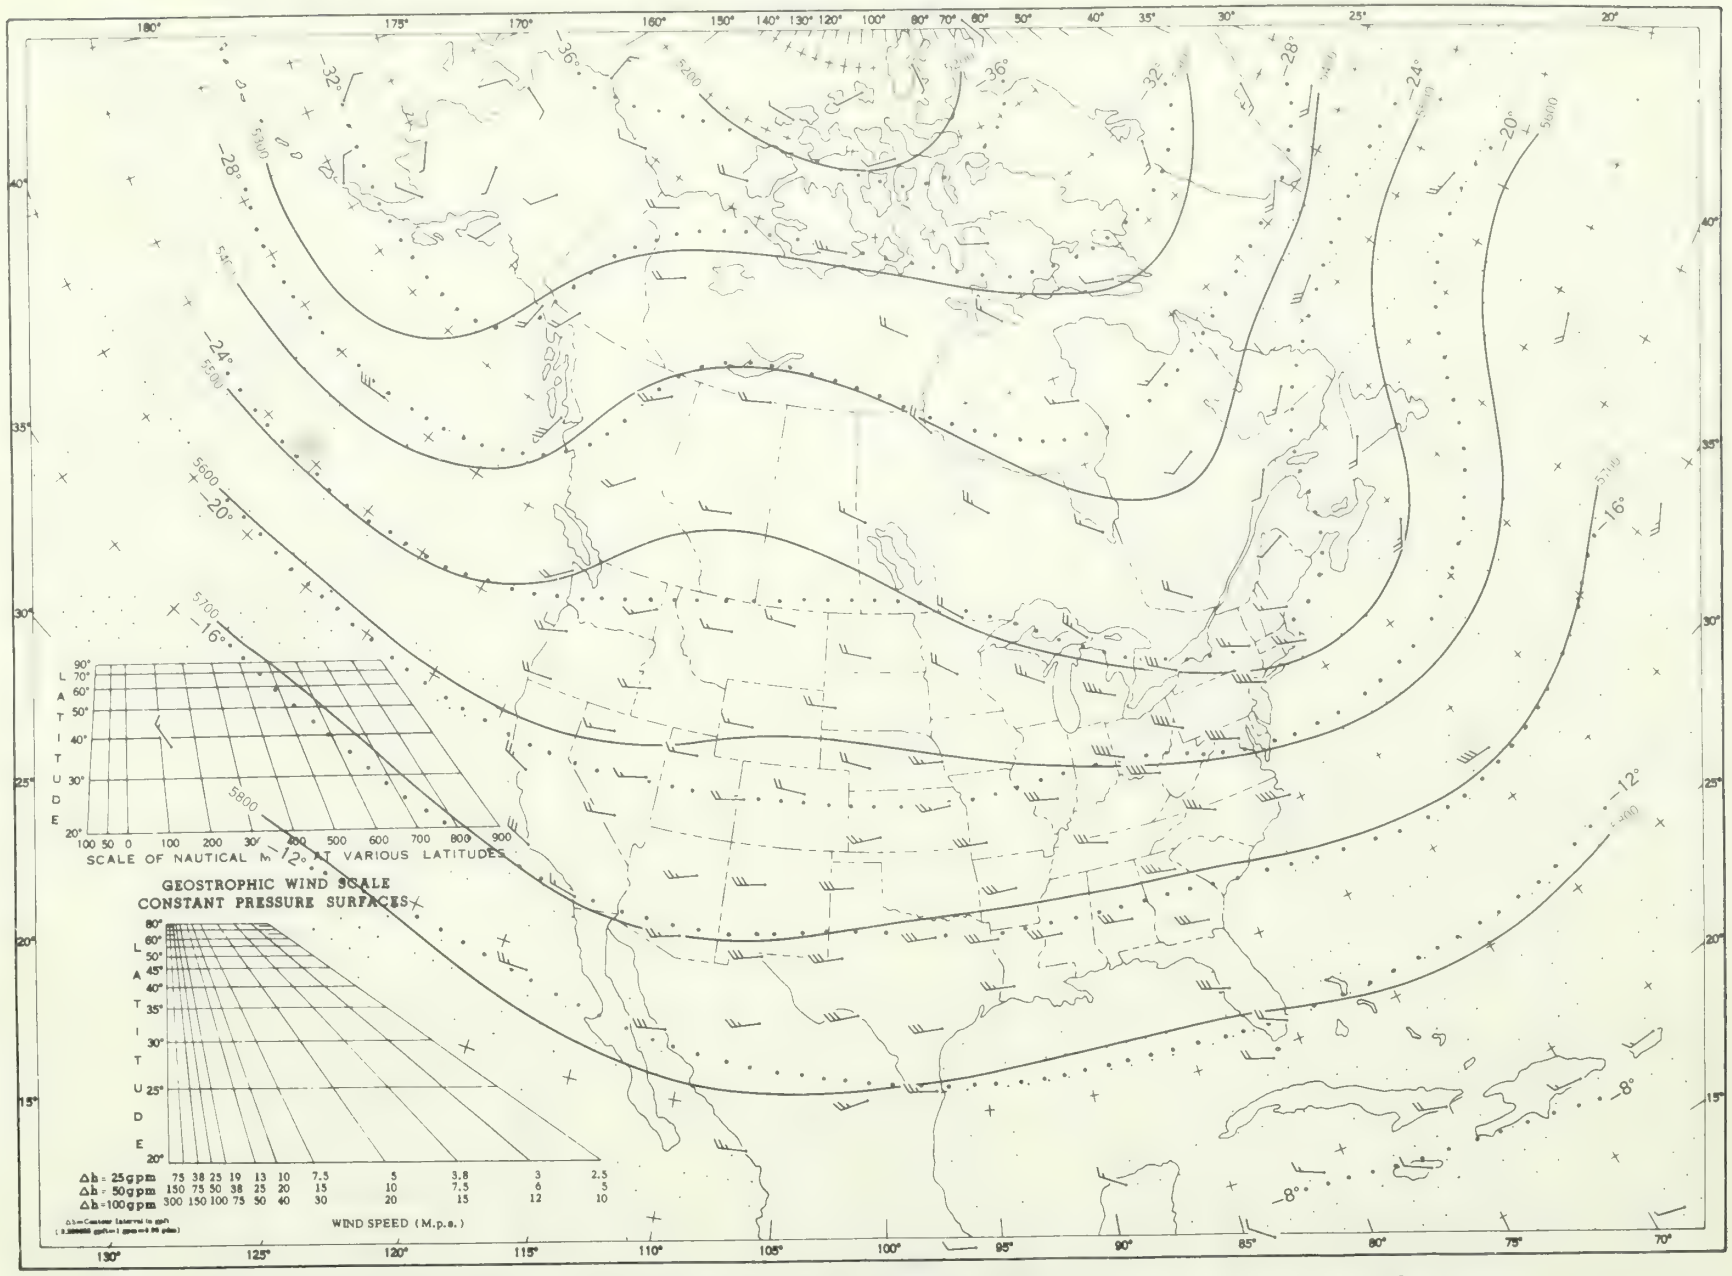
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X Average Sea Level Pressure (mb) and Resultant Surface Wind, **April 1971**. Inset Departure of Average Pressure (mb) from Normal, **April 1971**.



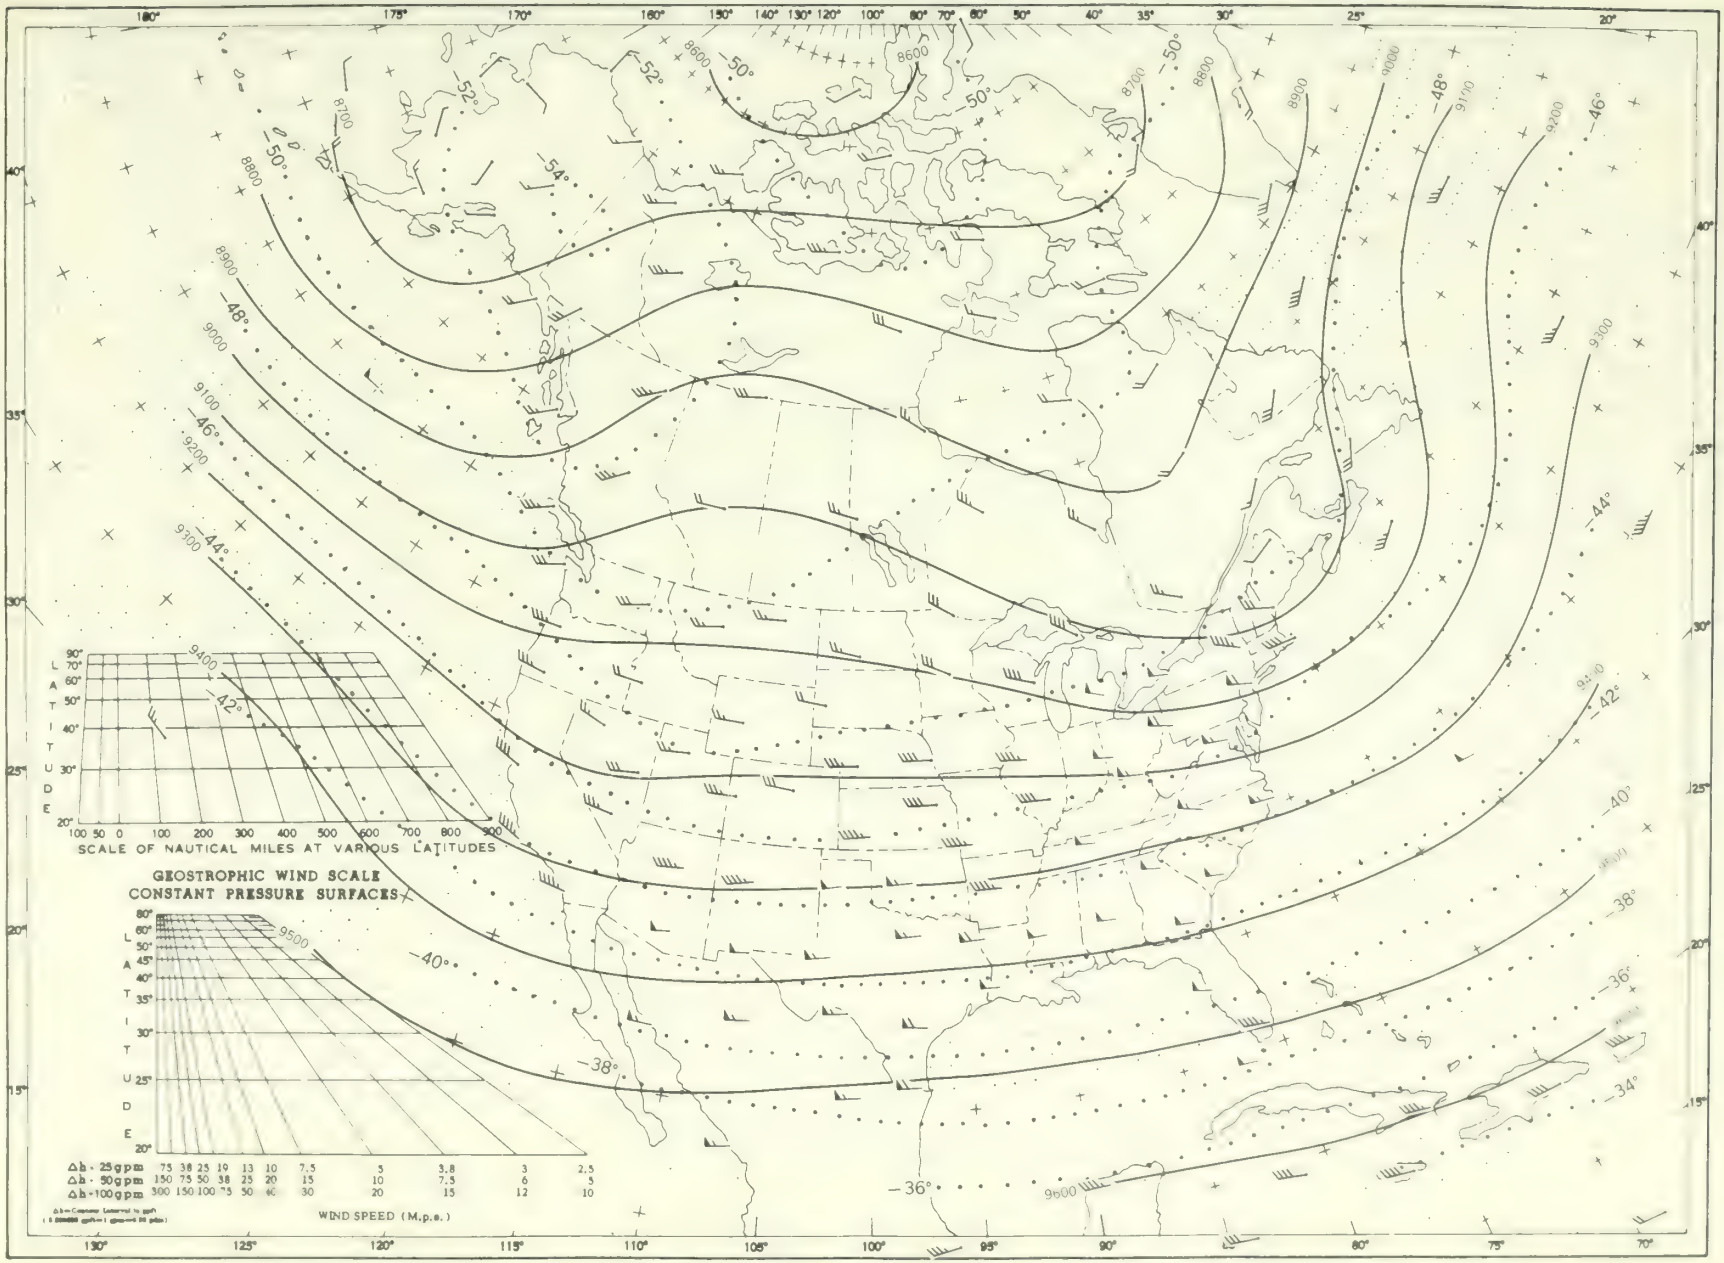
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed ÷ average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI 850-mb Surface, 1200 G.m.t., April 1971. Average Height and Temperature, and Resultant Winds



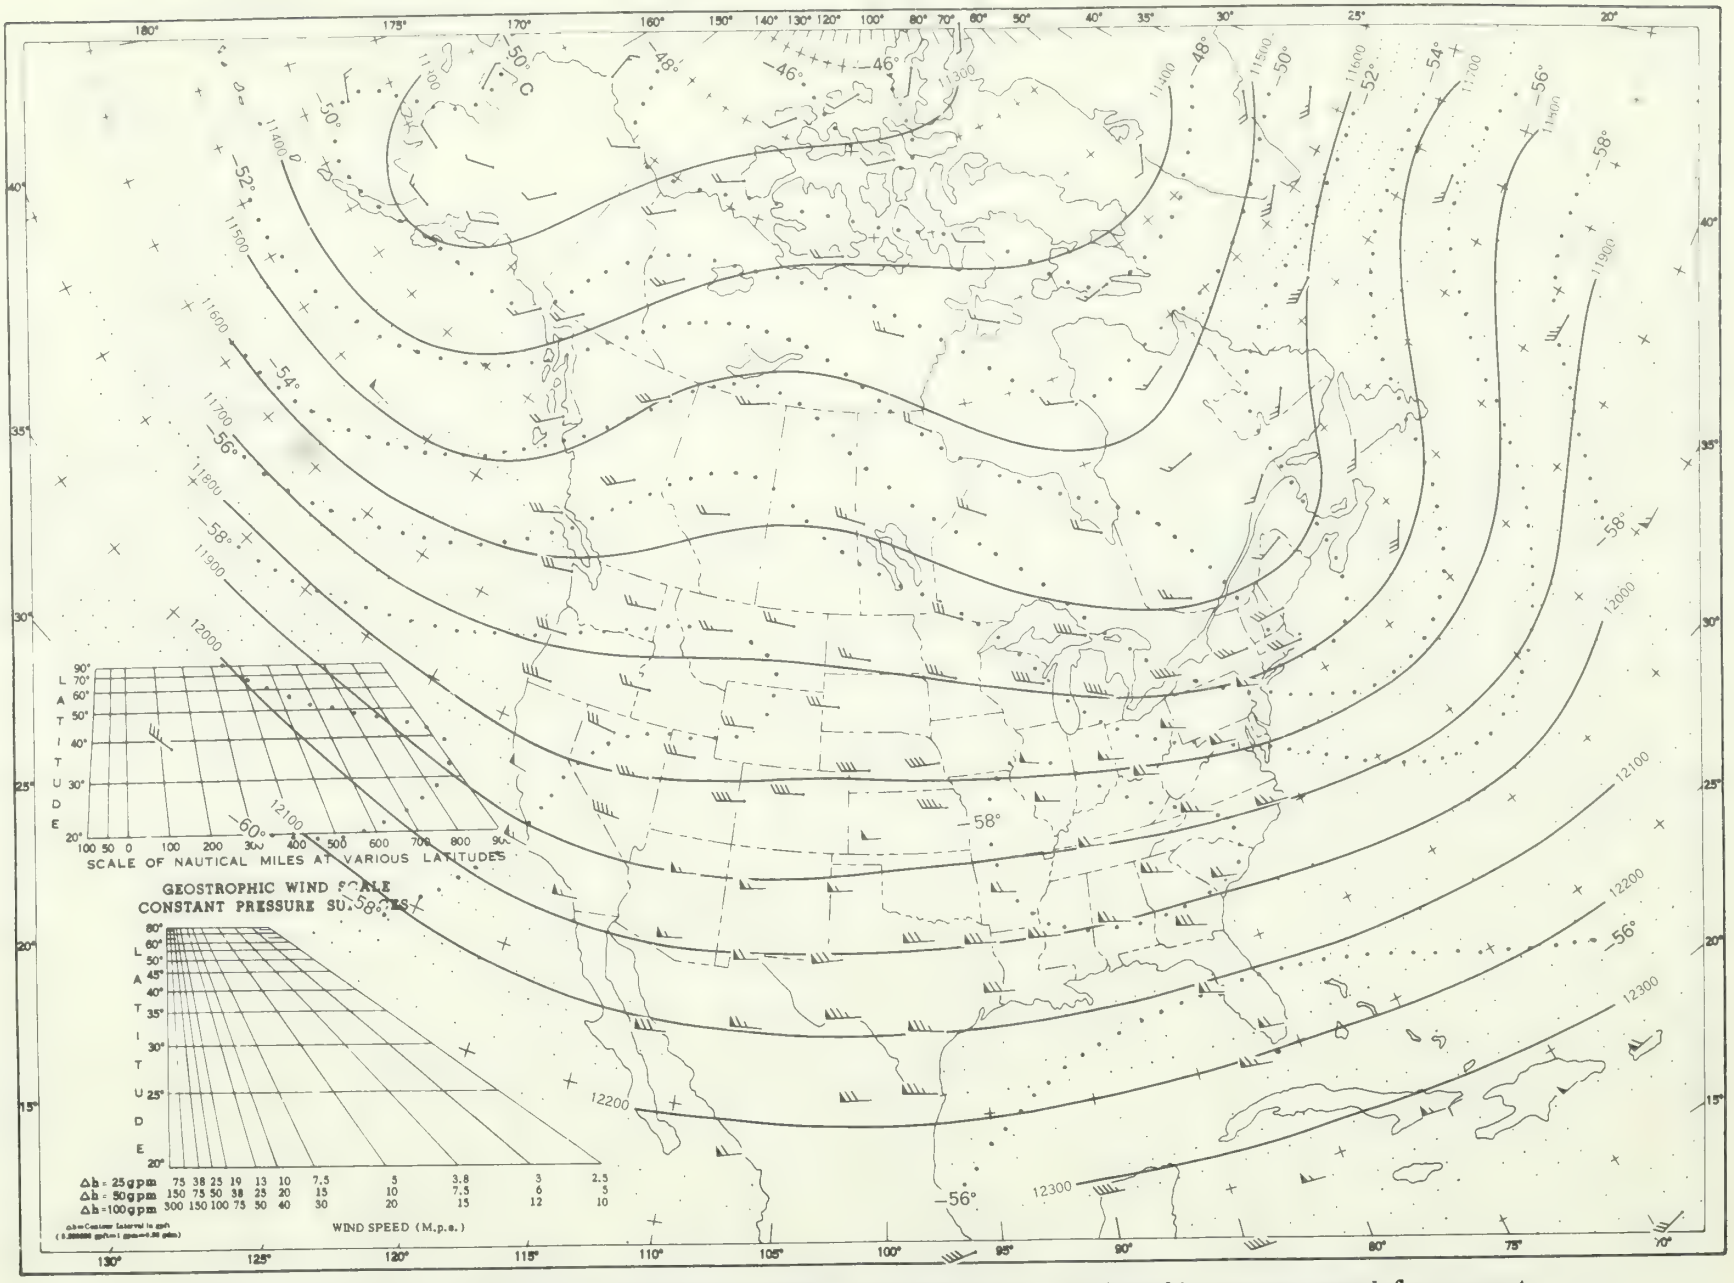
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 G.m.t., April 1971. Average Height and Temperature, and Resultant Winds



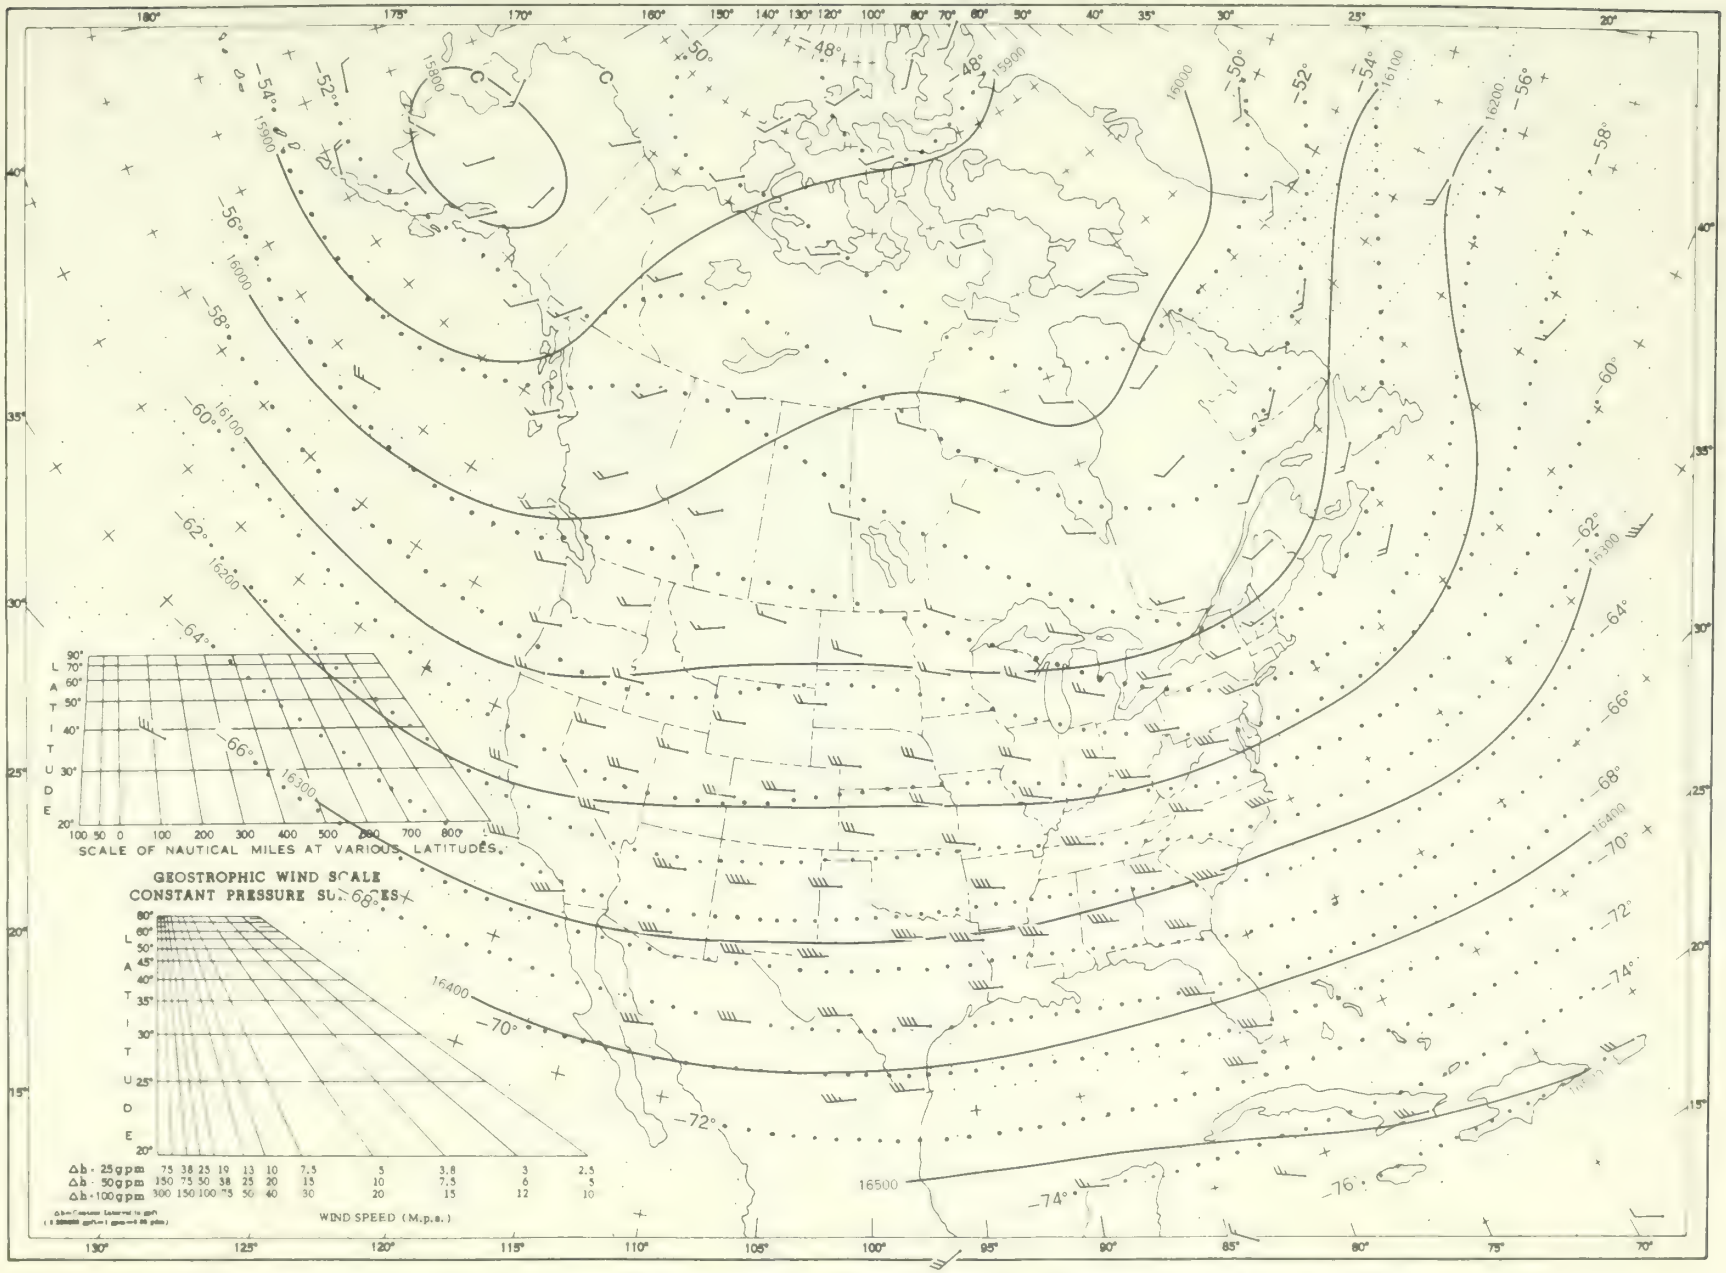
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 G.m.t., April 1971. Average Height and Temperature, and Resultant Winds



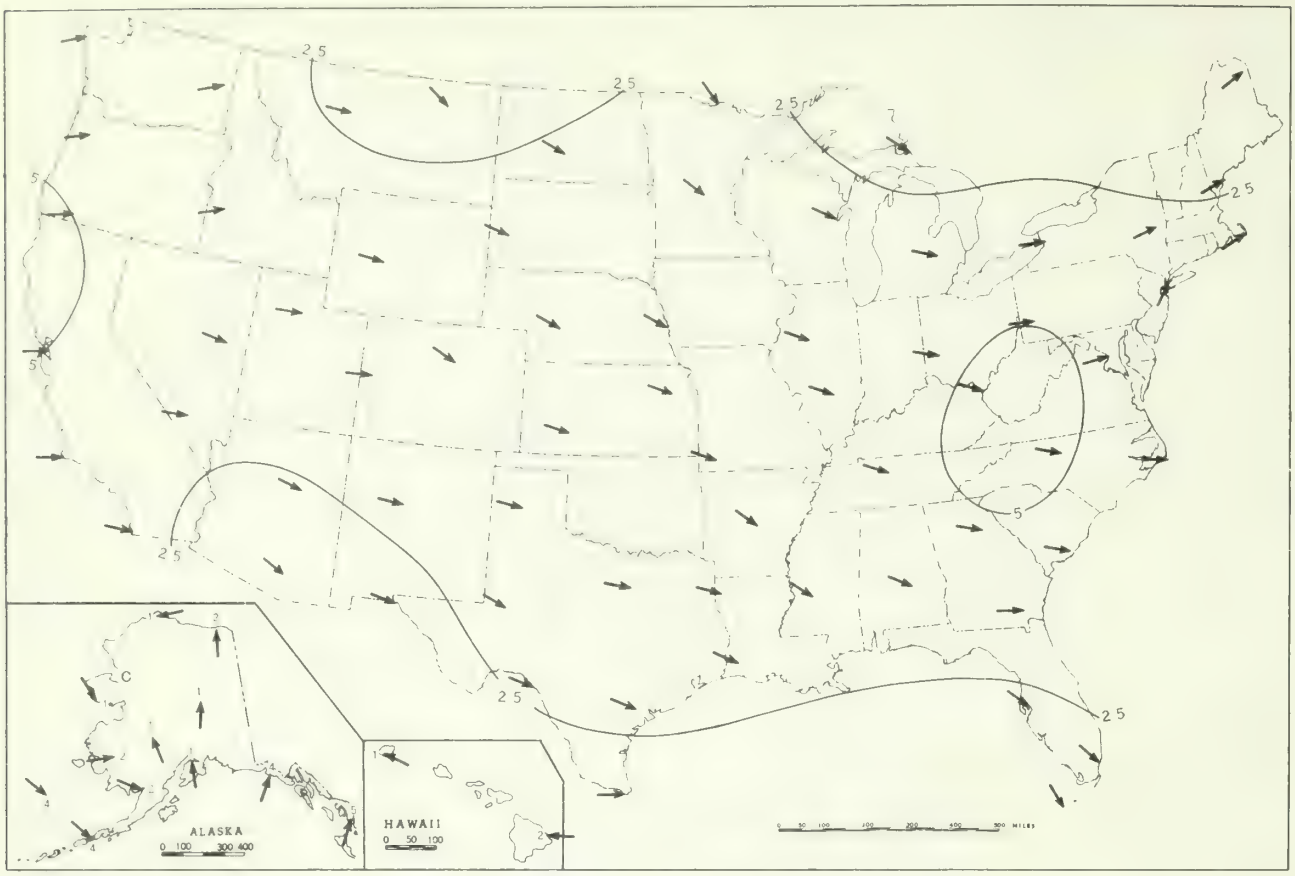
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV. 300-mb. Surface, 1200 G.m.t., April 1971. Average Height and Temperature, and Resultant Winds.



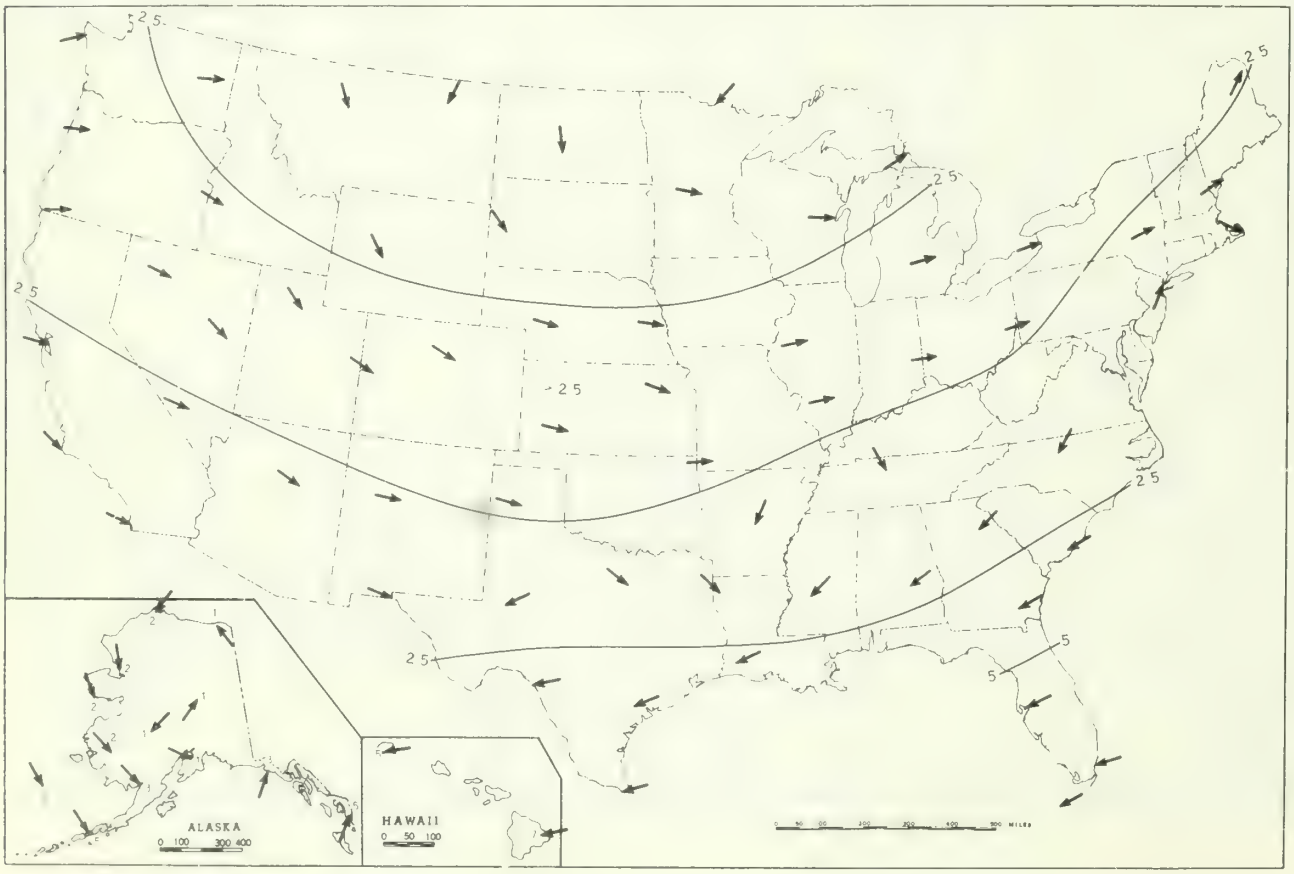
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV 200-mb. Surface, 1200 G.m.t., April 1971. Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI. 100-mb. Surface, 1200 G.m.t., April 1971. Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 G.m.t., April 1971. Resultant Winds.

B. 30-mb. Surface, 1200 G.m.t., April 1971. Resultant Winds.

Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 22 No. 5 MAY 1971

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:
1. Cool weather predominated over most of the Nation.
2. Heavy late snows fell at some western locations.
3. Severe weather frequented the Central and East.

TEMPERATURE--May temperatures averaged below normal over most of the Nation. The main exceptions included an area from central Washington to the Montana-North Dakota border; western, central, and southern Texas; and southern Florida. May 1971, was the second coolest May in 40 years at San Francisco, Calif., the third coolest in 100 years at Nashville, Tenn., and the coolest at Tallahassee, Fla., where the record began 88 years ago.

Cool weather prevailed over the Southwest and the East early in May. On the morning of May 4, the thermometer at Rome, Ga., dipped to 32°. Charlotte, N. C., and Tallahassee, Fla., registered 34° on the 4th. Never before had it been so chilly so late in the season at Charlotte and Tallahassee. The Great Plains were warmer than normal. Laredo, Tex., registered 98° on the afternoon of May 7. Pleasant temperatures were widespread at midmonth. The mornings were mostly cool and the afternoons mild. Detroit, Mich., recorded 30° and Midland, Tex., 39° on the 13th. These are location record low temperatures for so late in the season. Similarly, Burns, Oreg., set a new record low on the 17th with a 21° reading. Winslow, Ariz., set a new record on the 19th when the mercury dropped to 27°. High temperatures occurred in the southwestern deserts, 99° at Thermal, Calif., on the 12th, and in Florida, 95° at Orlando, on the 12th. Syracuse, N. Y., set a new record on the 19th when the thermometer climbed to 92°. It never before had been so warm this early in the spring at Syracuse. On the same date, Messina, N. Y., registered 95°. The last week of May was cooler than normal over most of the Nation. On the 28th, the temperature at Yuma, Ariz., never rose above 68°; this is 30° colder than the normal maximum 98°, for that date at Yuma. Much of the central Great Plains and the Ohio River Valley averaged 6° to 9° cooler than normal in the last week of May.

PRECIPITATION--Cold rain and drizzle fell in the Northeast early in May. Seven inches of snow fell at Mt. Washington, N. H., Monday evening, May 3. A storm developed in the central Rocky Mountains and moved slowly to the nearby Great Plains. Thunderstorms occurred in the Great Basin and the Rocky Mountains. Tornadoes touched down in the central Great Plains on May 5. Thunderstorms popped out over much of the eastern half of the Nation on the 6th and more tornadoes from Iowa to Indiana and southward to Texas and Kentucky. Some of the tornadoes in Oklahoma and Texas touched down in open country and caused little damage. Others demolished dwellings and other buildings in towns and villages, and on farms. A tornado pushed a train off the track near Rothville, Mo., on the evening of May 6.

Warm, moist gulf air flowed northward over mid-America in the second week of May releasing heavy rains as low pressure areas and their associated fronts moved eastward. Tornadoes occurred from Kansas to Texas and eastward to Mississippi. They caused a number of injuries and considerable damage to trees, powerlines, mobile homes, and other property. Severe thunderstorms with hail, high winds, and heavy rains occurred over portions of the central and southern Great Plains and the Deep South. About 5.50 inches of rain swamped Greenwood, Nebr., in 5 hours late on the 10th and more than 3.00 inches fell east of Lincoln, Nebr., between Elmwood and Murdock in 45 minutes. The heavy downpours flooded fields and closed roads. Hail from as small as marbles to as large as grapefruit, pelted the Lower Rio Grande Valley on the afternoon of May 11. One hailstone weighed 12 ounces. Heavy rains deluged many localities throughout the South in the 24-hour period ending at 7 a.m. May 12. A locality northwest of Little Rock, Ark., received 5.95 inches. The generous rains relieved the intense drought which had persisted in southern Florida for several months. The storminess over mid-America decreased near the end of the third week of May. The front that had stretched from the Great Lakes to the Texas Panhandle, moved eastward, and by May 20 lay along the Atlantic coast from New England to the Florida Panhandle, thence westward to southern Texas. Generous showers fell along the front.

On May 18, another storm was getting organized in the Far West. It spread several inches of snow at spots in the northern and central Rocky Mountains and the northern Great Plains. Alamosa, Colo., received 5 inches of snow during the forenoon of May 18. Six inches fell at Hill City, Minn., on the 19th. Five inches of snow whitened the eastern slope of the Sierra Nevadas on May 20. Seven inches fell at Reno, Nev., on the 21st. This is the most snow that has ever fallen at Reno so late in the spring. High winds in the West drifted the snow badly. Where there was no snow, the winds whipped up dust and sand. As the storm crossed the Rocky Mountains and moved to the western edge of the Great Plains, it produced thunderstorms, some with large hail, heavy rain, strong winds, and a few tornadoes. The most severe weather covered an area extending from the upper Mississippi River Valley to central Texas. Stormy weather continued over the central and eastern portions of the Nation in the last week of May. Some previously dry areas in California and Texas received rain late in the month.

May precipitation ranged from exceedingly heavy to very light when compared with the long-time records. The total at Casper, Wyo., 5.59 inches, exceeded all previous May totals. Other records were broken at Bakersfield, Long Beach, and San Diego, all in California. Only a light sprinkle, too small to measure, fell at Roswell, N. Mex. This was the driest May of record at Roswell. May 1971 was the driest since 1885 at Milwaukee, Wis., where only 0.90 inch fell. Lynchburg, Va., set a new record, receiving 9.07 inches of rain in May 1971.

Paradise Ranger Station, at 5,000 feet elevation on the south side of Mt. Rainier, Wash., received 1,017 inches (almost 85 feet) of snow in the 1970-71 season. This is the most snow that has fallen at any station in the United States in one season.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1 C. or above for Alaskan Stations.
Y Peak Gust
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

Includes crop damage.
C Crop damage.
* No occurrence of storms or unusual weather phenomena reported.
‡ Includes heavy sleet storm.
\# Freezing drizzle and freezing rain, commonly known as glaze.
Ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5 Million
7 $5 Million to $50 Million
8 $50 Million to $500 Million
9 $500 Million to $5 Billion.

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS
MAY 1971

Elmer R. Nelson, Office of Hydrology

The most serious flooding during May occurred in north-central Kansas. The lower Saline River reached near record proportions. This was the first significant overflow on the lower Saline since 1961. Major overflows occurred over the lower Republican and the Little Blue Rivers.

Major ice-jam flooding occurred in southwestern Alaska towards the end of May.

ATLANTIC SLOPE DRAINAGE

Above normal to a near record snowpack over northern New England early this spring melted gradually and caused moderate flows in many larger rivers and streams but no flooding. Heavy rains late on the 3d and early on the 4th caused minor flooding of small streams through parts of Vermont, New Hampshire, and Maine. Minor lowland overflows occurred along larger rivers and streams except in Rhode Island. The minor flooding lasted from one day in northern sections to over one week in central and southern Connecticut along the Connecticut River. Only minor flood damage resulted from the overflows.

Precipitation during May in the Delaware River Basin above Trenton, N. J., averaged around 4.2 inches or about 107 percent of normal. In the basin below Trenton, the precipitation averaged about 5.5 inches or 134 percent of normal. In northern New Jersey, the rainfall totaled 4.4 inches or 107 percent of normal and in the southern portion, 4 inches or 106 percent of normal.

All major water-supply reservoirs in New Jersey by the end of May were filled to capacity and spilling. Pumped storage at Round Valley, N. J., was 94 percent of capacity by the end of May. New York City's three reservoirs on the upper Delaware spilled during May and were full to capacity at the end of the month. Lake Wallenpaupack increased storage during May by 1.8 billion gallons and reached 88 percent of capacity at the end of May.

Light to moderate flooding occurred in the James Basin in Virginia, during the latter part of May and the first part of June. Flood duration ranged from a few hours in the upper basin to 88 hours at Richmond. Damages were slight. The flooding was due to prolonged rains averaging about 3-1/2 inches on May 28-30.

Heavy rains on the 12th-13th caused flash flooding on a few streams in the Roanoke Basin. One road in northern Campbell County, Virginia, was closed for a short period. The Neuse River at Neuse, N. C., reached bankfull stage on the 14th. Before the slower flowing streams in eastern North Carolina subsided, additional showers and thundershowers on the 15th-16th caused the upper Dan and Roanoke Rivers to rise 1 to 3 feet over their banks. A significant rise on the upper Cape Fear River produced 6 feet of overflow in the lower portion. The upper half of the Neuse River ran around bankfull level to slightly above.

Heavy rain on the 12th-13th and again on the 15th caused minor flooding on streams in the Pee Dee and Santee River Basins in South Carolina. The Rocky River at Norwood, N. C., crested 7 feet above flood stage on the 16th. The Lumber River at Lumberton, N. C., continued out of its banks from the 18th to the 25th. The main stem of the Pee Dee River below Blewett Lake continued in flood from the 15th to the 27th. The crests ranged from 4 feet above flood stage at Peedee, S. C., to 8 feet above flood stage at Cheraw, S. C. Overflow at Lake Wateree was not prolonged and minor flooding occurred below Chappells, S. C.

Heavy rains on the 15th produced some local flooding on the Savannah, Ogeechee, and Oconee Rivers in Georgia. Stevens Creek at Modoc, S. C., exceeded flood stage by nearly 6 feet on the 15th-17th. Damage was very light.

EAST GULF OF MEXICO DRAINAGE

There were two periods of flooding along the Apalachicola River in northwest Florida at Blountstown, Fla., during May. The first overflow on the 1st-6th was due to heavy rains during the latter part of April. The second overflow was due to several periods of rain from the 9th to the 16th. Twenty-four-hour precipitation amounts exceeded 1 inch several times at most stations during this period.

Heavy rains averaging over 4 inches at some stations caused minor flooding in the Tombigbee Basin in Mississippi and Alabama. No damage of consequence was reported.

Considerable lowland flooding occurred on the Pearl River from Edinburg, Miss., downstream to Pearl River, La., during most of May. This flooding was due to heavy rainfall on the 7th-13th. Drainage from the upper Pearl River resulted in excessive discharges from the Ross Barnett Reservoir. By the 15th, the Pearl River had reached a stage of 32.7 feet at Jackson, Miss., or nearly 15 feet above flood stage. Cattle and equipment were removed from the inundated areas before the rising waters made it impossible. Timber cutting and some road maintenance came to a halt. Fields in the flooded area will have to be replanted.

MISSISSIPPI SYSTEM

Upper Mississippi Basin--The main stem of the Mississippi River receded within its banks at Libby, Minn., on May 3 and at Keithsburg, Ill., and Hannibal, Mo., on May 1. There was no other flooding in the Upper Mississippi Basin during May.

Missouri Basin--Minor flooding occurred during May in the headwaters of the Missouri Basin in Montana due to the melting of a record mountain snowpack. There were two periods of flooding along the Big Hole and East Gallatin Rivers. Some minor flooding occurred along the Sun River towards the end of the month. No reports of damage were received.

Minor flooding occurred on the North Platte River and several of its tributaries in Colorado during May. The Cache la Poudre on the South Platte River overflowed its banks at a few places toward the end of the month. No important damage resulted.

Heavy rains over the upper reaches of the South Platte River produced three-fourths bankfull crest at North Platte, Nebr., on the 4th and again on the 11th-15th. Due to the releases and heavy rains on the North Platte and South Platte Rivers, the Platte River below North Platte, Nebr., ran near bankfull with some overflow. Flooding was limited to accretion land and some pastures. Heavy rains of 5 to 6 inches over the Salt Creek Basin produced bankfull stage at Ashland, Nebr., on the 10th. Property damage from the flooding was slight.

Serious and near record flooding occurred over the lower Saline River in Kansas on the 21st-22d. Major overflows occurred over the lower Republican River, the

Little Blue River of Kansas, and several tributaries in north-central Kansas during the afternoon of the 21st-24th. Considerable flash flooding occurred on small streams on the 21st-22d. The crest of 29.8 feet on the Saline River at Tescott, Kans., was only 0.3 foot below the record flood of July 13, 1951. This was the first significant overflow in the lower Saline River since May 25, 1961. Although several significant overflows have occurred on the lower Republican over the last few years, the crest of 19.2 feet at Clay Center, Kans., on the 22d was the highest since May 22, 1961. Considerable agriculture damage resulted from the overflows.

Heavy rains (1 to 2.5 inches) during the afternoon and evening of the 11th caused significant rises on the Big Blue and Lamine Rivers. The Big Blue River at Bannister Road in Kansas City, Mo., rose to within 1-1/2 feet of bankfull stage, while the Lamine River at Clifton City, Mo., rose to about a foot above bankfull stage by late on the 12th.

The main stem of the Missouri River rose to bankfull stage at Clifton City, Mo., on the 12th. Another considerable rise occurred from Kansas City downstream beginning on the 23d. Lexington and Waverly, Mo., were near bankfull from the 26th to the 29th. Occasional rains over this area and the releasing of water from the reservoirs in Kansas along the Kansas River produced this rise.

Ohio Basin--Flash flooding occurred during the forenoon of the 6th on many small streams in extreme east-central Ohio and southwestern Pennsylvania and the northern panhandle of West Virginia. Wheeling Creek was especially hard hit. A bucket survey conducted by the U. S. Engineers showed up to 7 inches of rain near Calis, W. Va. Damage reports are incomplete but many summer cottages and basements of houses were flooded. In eastern Ohio some overflow was reported on Beaver Creek in Columbiana County. One man was drowned when he was swept from a small bridge. Some minor flooding occurred on Chartiers Creek at Houston, Pa., in the southwestern portion. Some flash flooding was reported at Hickory and at White Oak Boro near McKeesport, Pa. Ten Mile Creek around Waynesburg, Pa., was the highest in 3 years.

Heavy showers and thundershowers on the 5th-6th caused flooding on the Tug Fork at Williamson, W. Va., and on the Levisa Fork at Prestonsburg, Ky., on the 7th-8th. The crest of 30.0 feet at Williamson was 3 feet above flood stage. The city of Williamson is protected by a flood wall to 44 feet. There was some damage downstream from Williamson at Chatteroy, W. Va., and upstream at Matewan, W. Va. There were numerous small creeks that went out of their banks in eastern Kentucky and southwestern West Virginia. The headwater areas of the Big Sandy River in Virginia received 2 to 3.4 inches of rain and the Tug Fork 1.7 inches at Williamson, W. Va., to near 3 inches in the headwaters during the afternoon and night of the 6th. Considerable damage resulted to crops where farmland flooded along small creeks and to country roads and bridges. Civil Defense estimated damage in eastern Kentucky at $115,500. In southwestern West Virginia quite a few roads were cut off during the high water. No estimate of damage is available, but it is believed to be small.

Heavy rains (3 to 4 inches) from the evening of the 6th through the night of the 7th caused flooding on the North Fork of the Kentucky River on the 7th-8th. The crests ranged from 2.3 feet above flood stage at Jackson, Ky., to nearly 5 feet above flood stage at Hazard, Ky. The Corps of Engineers estimated the damage at $288,000, of which $239,000 occurred at Hazard, Ky.

Heavy rain on the 6th-7th caused minor flooding on the Cumberland River in southeast Kentucky on the 7th-8th. The rain averaged about 2.5 inches over the basin above Williamsburg with the heaviest amounts in the upper portion near Cumberland, Ky. Damage to crops was estimated at $100,000. Moderate to heavy rains (2 to 3 inches) on the 11th-12th caused moderate flooding at Barbourville, Ky., and minor flooding at Williamsburg, Ky., on the 13th-16th. Damage was confined mostly to crops. The county agent estimated the damage at $100,000.

General light rainshowers and locally heavy thundershowers fell along the Ohio Valley almost daily from the 2d through the 13th causing the Ohio River to rise above flood stage at several points by the 14th. Flood damage was confined to crops in the bottomland along the Ohio River. The Corps of Engineers estimated that 105,900 acres were inundated causing $1.2 million damage.

Arkansas Basin--Heavy rains on the 21st and 22d caused flooding in the upper portions of the Neosho and Cottonwood Rivers in Kansas on the 22d-25th. Several stations reported rainfall amounts between 5 and 6.5 inches. The total damages were estimated at $752,000.

Lower Mississippi Basin--Generally heavy rainfall on the 7th-13th caused the Big Black River at Bovina, Miss., to rise above flood stage on the 12th. It crested on the 16th nearly 10 feet above flood stage. Lowland flooding continued along the Big Black River below Pickens, Miss., most of the latter half of the month. Damage to livestock and equipment was held to a minimum.

WEST GULF OF MEXICO DRAINAGE

Heavy thundershowers in the upper Brazos Basin caused flash flooding at Eastland, Tex., during the early morning of the 29th. The Eastland cooperative observer reported 6.25 inches of rain for the 24-hour period ending at 7 a.m. on the 29th and 1.8 inches on the 30th. This was preceded by 1.74 inches on the 28th. Water flooded some low houses including the police and fire stations at Eastland.

Heavy rains (6 to 8 inches) near Knox City, Tex., washed out a section of railroad tracks, derailing 4 cars of a Santa Fe freight train on the morning of the 29th. Runoff from these rains produced a crest of 7.7 feet at Seymour, Tex., on the upper Brazos on the 30th. Flood stage is 12 feet.

Extreme drouth conditions continued along the upper Trinity Basin and much of the upper Brazos Basin during May.

Heavy rainfall (3 inches) during the early morning hours of the 29th caused minor flooding on Aquilla Creek at Aquilla, Tex., on the 30th. The crest was 2.3 feet above flood stage.

GREAT BASIN

Minor flooding occurred during May due to snowmelt runoff on numerous low elevation streams in Utah, Wyoming, and Nevada. Flooding along the Humboldt River in Nevada was confined mostly to farms or ranches. Some ranches set dams to help flood irrigate their property. A few wood bridges were washed out, but no substantial damage was reported.

Minor flooding occurred on Ham's Fork near Kemmerer, Wyo., on May 12-14, with most of the flooding confined to farmlands. A few basements were flooded.

Smiths Fork near Cokeville, Wyo., in the Bear River drainage experienced some minor flooding about the same time.

PACIFIC SLOPE DRAINAGE

Columbia Basin--Record or near-record snowpack was reported in many parts of the Columbia Basin during the latter part of April. Temperatures during the first four days of May and on the 7th-12th were 7° to 12° above normal. Snowmelt streams in all parts of the Columbia Basin responded to the warm weather with rapid rises by May 5, and remained above the critical point until cresting at mid-month. Larger streams in all parts of the Columbia Basin experienced continuous rises until crests were reached on May 14-15.

Heavy rains at mid-month added water to the already swollen streams, mainly from the central mountains and plains through the upper reaches of the Snake River Drainage. Cooler weather stabilized the streamflow as the freezing level dropped well below in the heavily snowpacked headwater areas.

The Spokane River at Spokane, Wash., crested at flood stage on May 15-17. The Kootenai River approached within 0.7 foot of flood stage at Rexford, Idaho, on the 29th and within 0.5 foot of flood stage at Bonners Ferry, Idaho, on the 31st. No significant damage resulted from the high water.

The Henry's Fork near Rexburg, Idaho, continued above flood stage from the 6th to June 10. Near St. Anthony, Idaho, the river was slightly above flood stage on the 13th-14th. The Portneuf River at Pocatello, Idaho, rose above flood stage on the 5th and continued in flood to the 21st. The crest on the 14th was 1.7 feet above flood stage. There were two overflows on the Big Wood River at Hailey, Idaho. The first on the 8th-17th and the second one the 27th to June 28. Minor damage resulted from water overflowing onto pasture and farmland.

Stages in the lower Columbia at Vancouver, Wash., on May 1 were held near 7 feet by a reservoir control operation to permit the safe downstream migration of juvenile salmon. The snowmelt runoff from the lower Snake and local area tributaries due to the above normal temperatures caused the Columbia River to reach flood stage on the 6th and attain a crest of 20.2 feet for the season on May 15. The Willamette River at Portland, Ore., in backwater from the Columbia River, reached flood stage on the 9th and a crest of 19.5 feet on the 15th.

Heavy precipitation on the 25th caused a flash flood in the normally dry Shobe Canyon southwest of Heppner, Oreg. Extensive damage occurred in that community as flood waters joined Willow Creek and moved through Heppner.

ALASKA

Major ice-jam flooding occurred in southwest Alaska towards the end of May. Many of the inhabitants in the eastern half of Bethel, Alaska, were forced to leave due to the high water on the Kuskokwim River. Most of the residents of Napakiak, Oscaiville, and Napaiskak were evacuated. On the Yukon River, ice-jam flooding extended about 100 miles upstream of the town of Russian Mission to Grayling. The town of Anvik was the hardest hit with the inundation of its power plant. In northwestern Alaska, backwater from ice jams flooded the village of Kobuk on the Kobuk River.

See reference note at end of table

the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

\+ Observations for these stations are scheduled at 0000 G. c. t.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun. MAY 1971

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Station	Day of month

Note.--Langley is the unit used to denote one gram calorie per square centimeter.

Values with an asterisk are interpolated.

U Indicates Urban sites.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska — MAY 1971

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	63	106	106	197	132	125	78	225	226	141	159	148	89	199	197	229	66	165	226	193	241	159	131	210	215	113	63	114	212	72	25	149

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (λ 3900 Å) at Ames, Iowa

These data are from an U - V Epply total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code as defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Chart I. A. Normal Daily Average Temperature (°F. 1931-60), May.

B. Temperature Departure from 30 - Year Mean (°F 1931-60), **May 1971.**

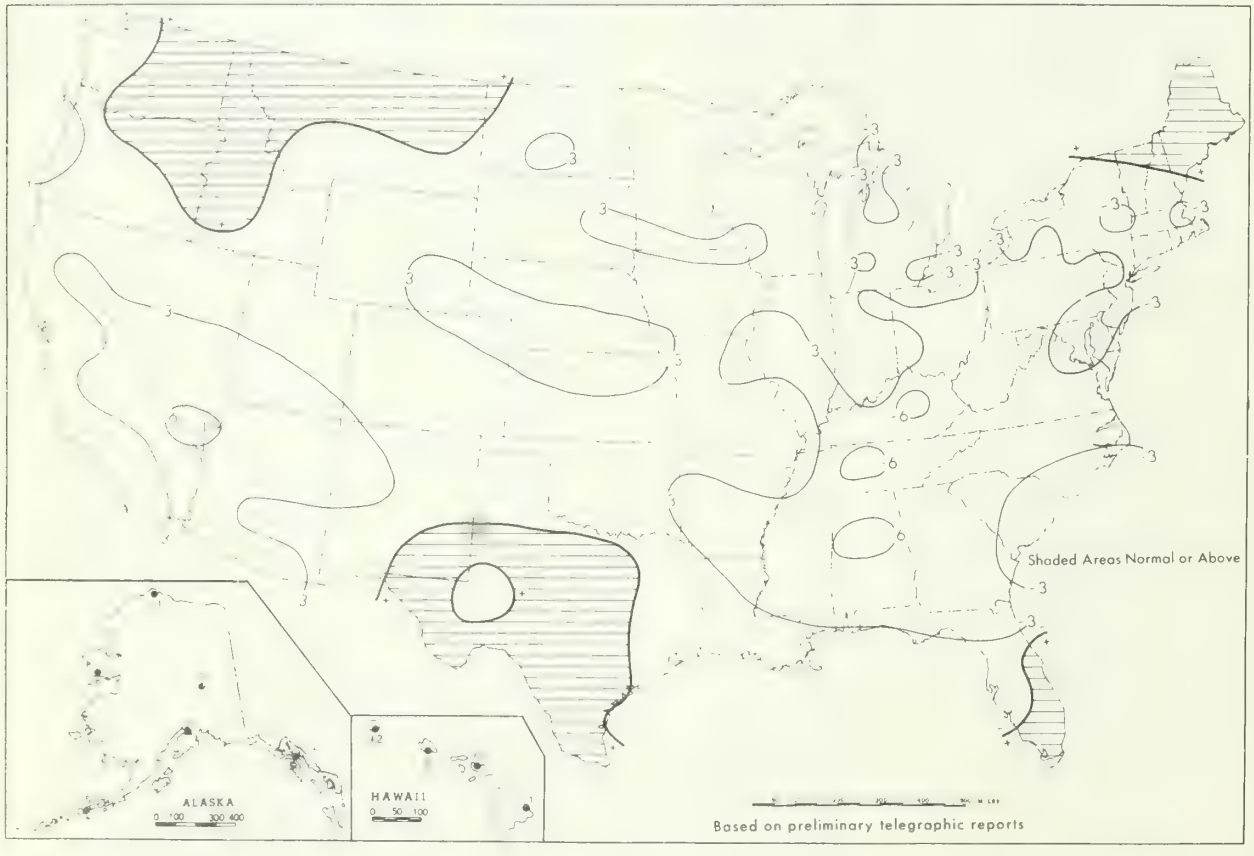

Chart II. Total Precipitation (Inches), **May 1971.**

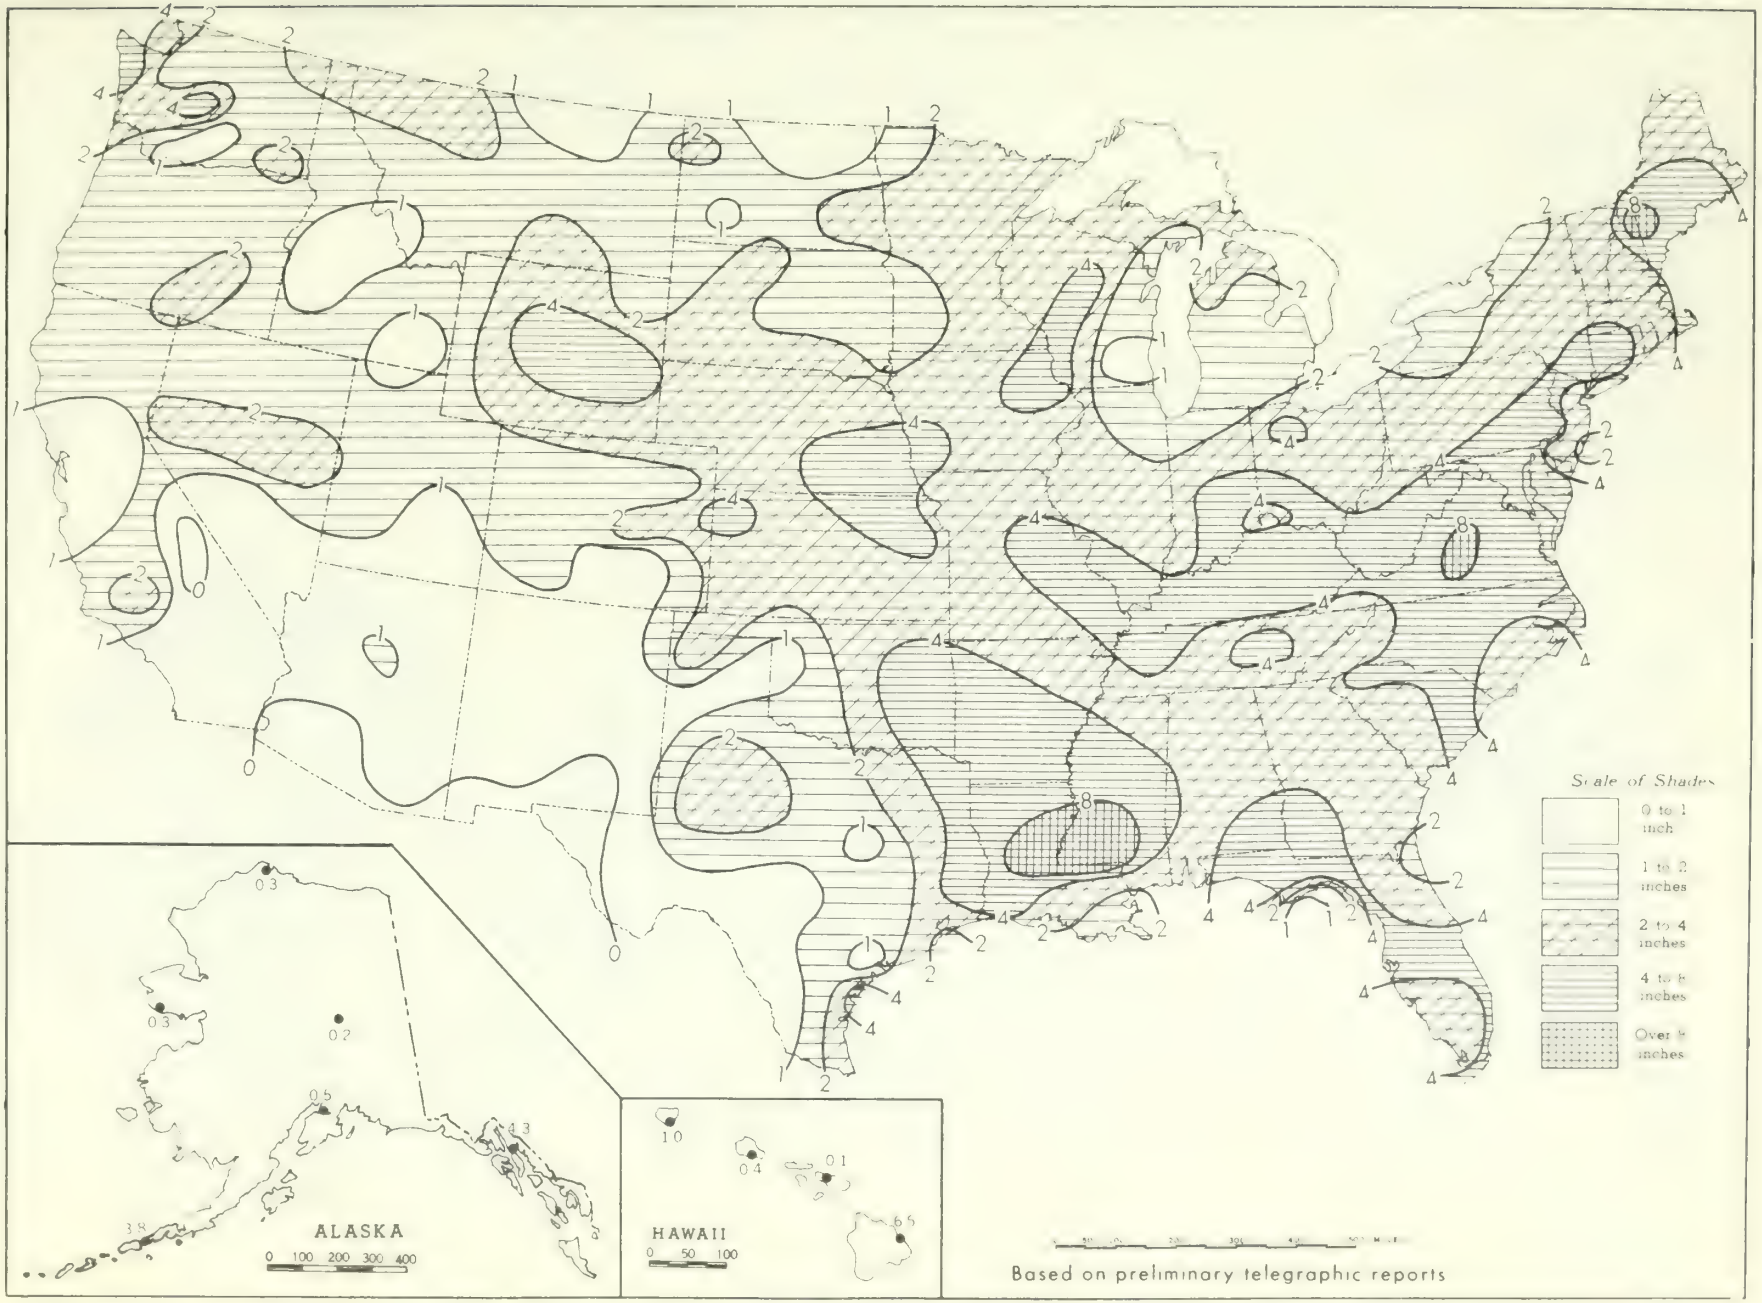

Chart III Percentage of Normal Precipitation, **May 1971.**

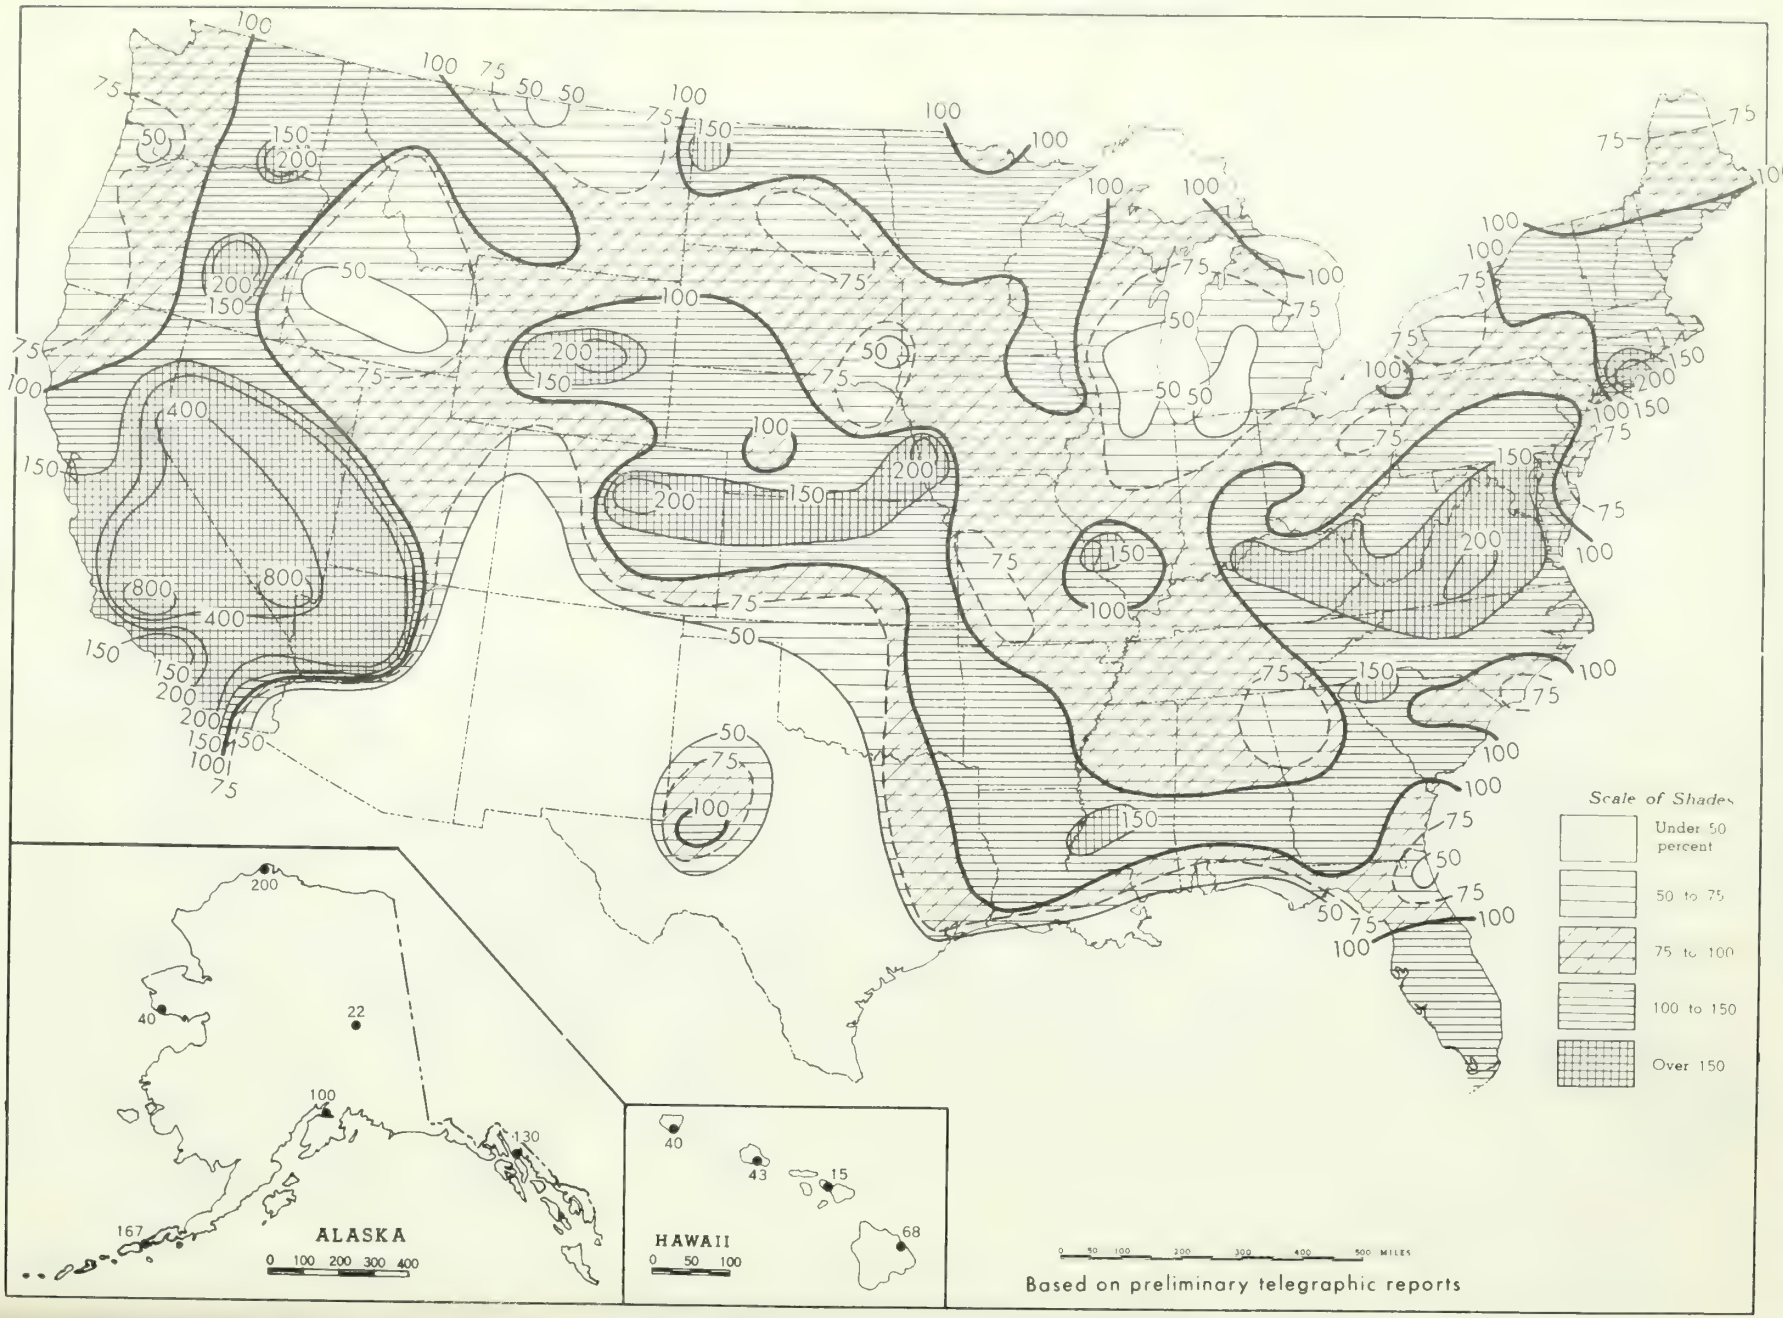

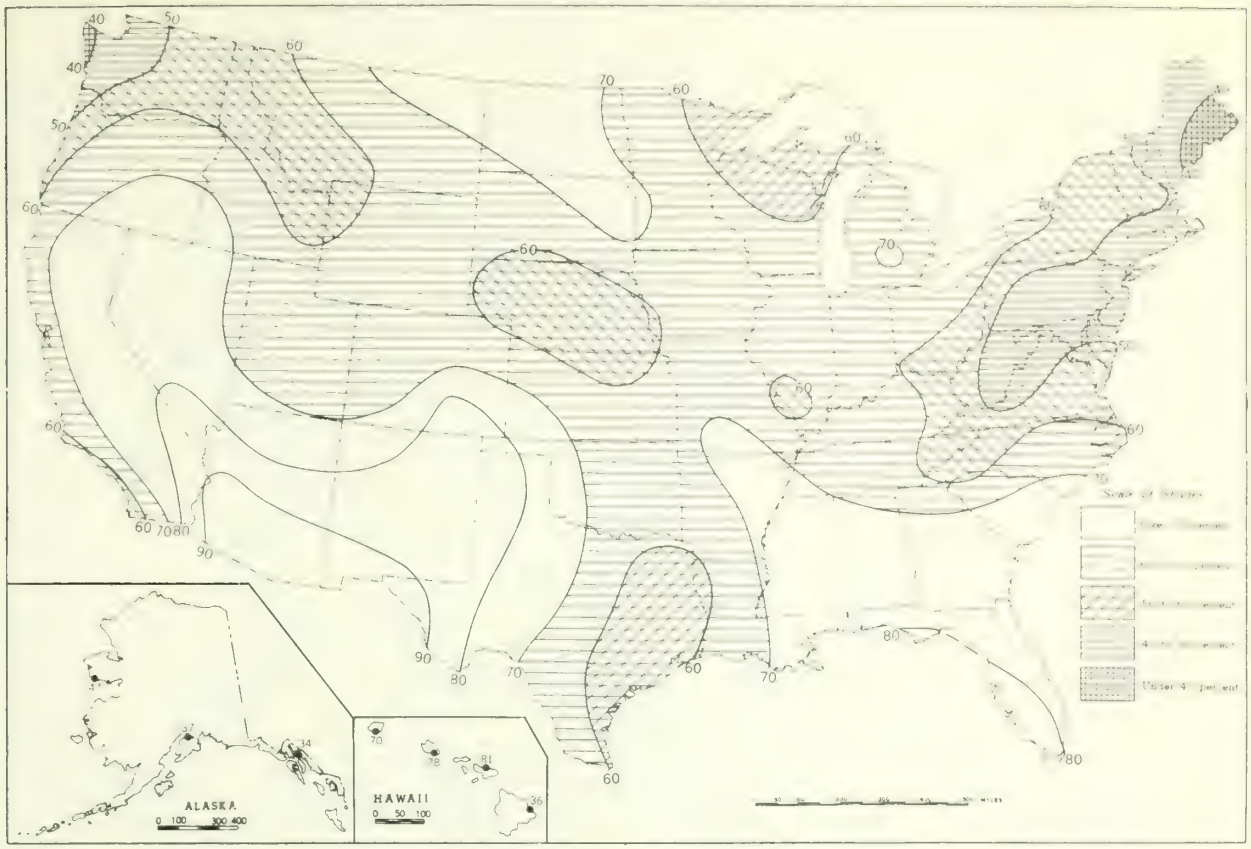

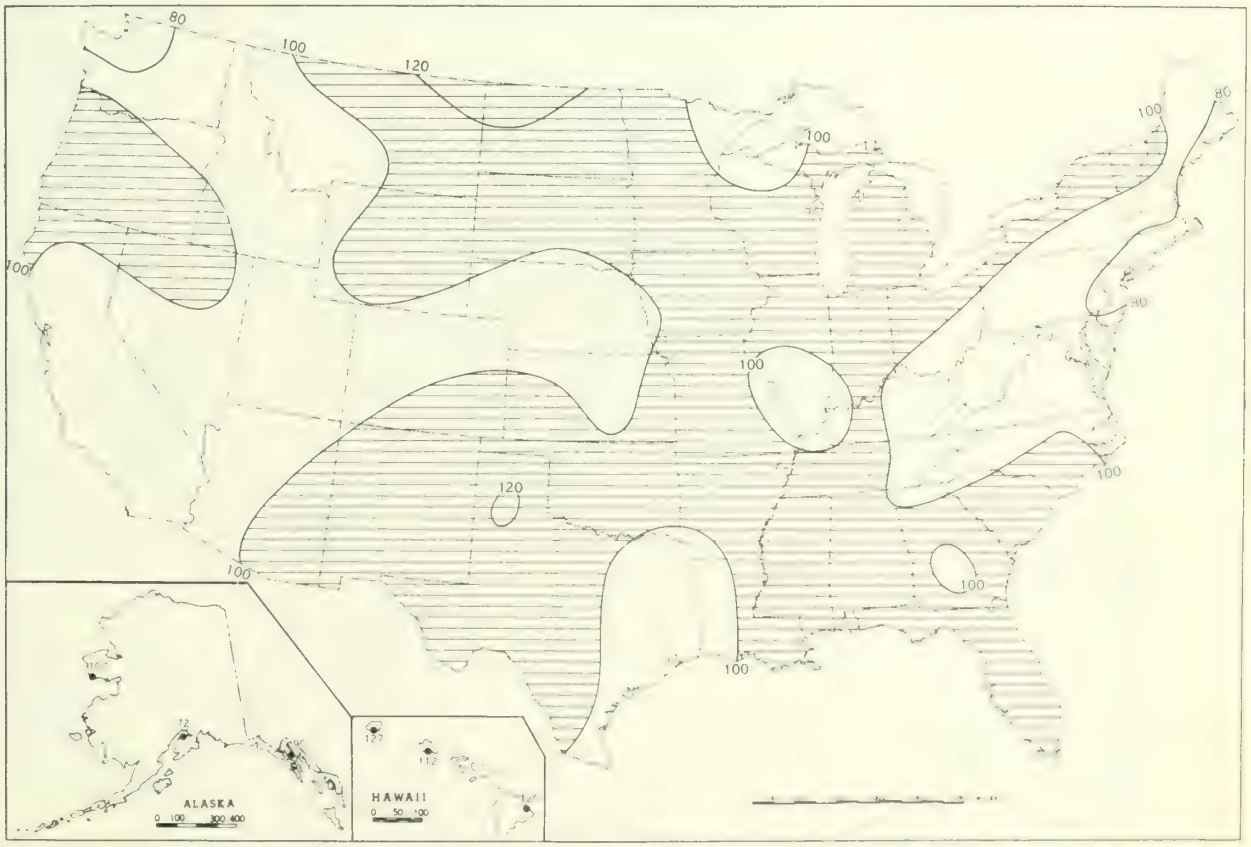

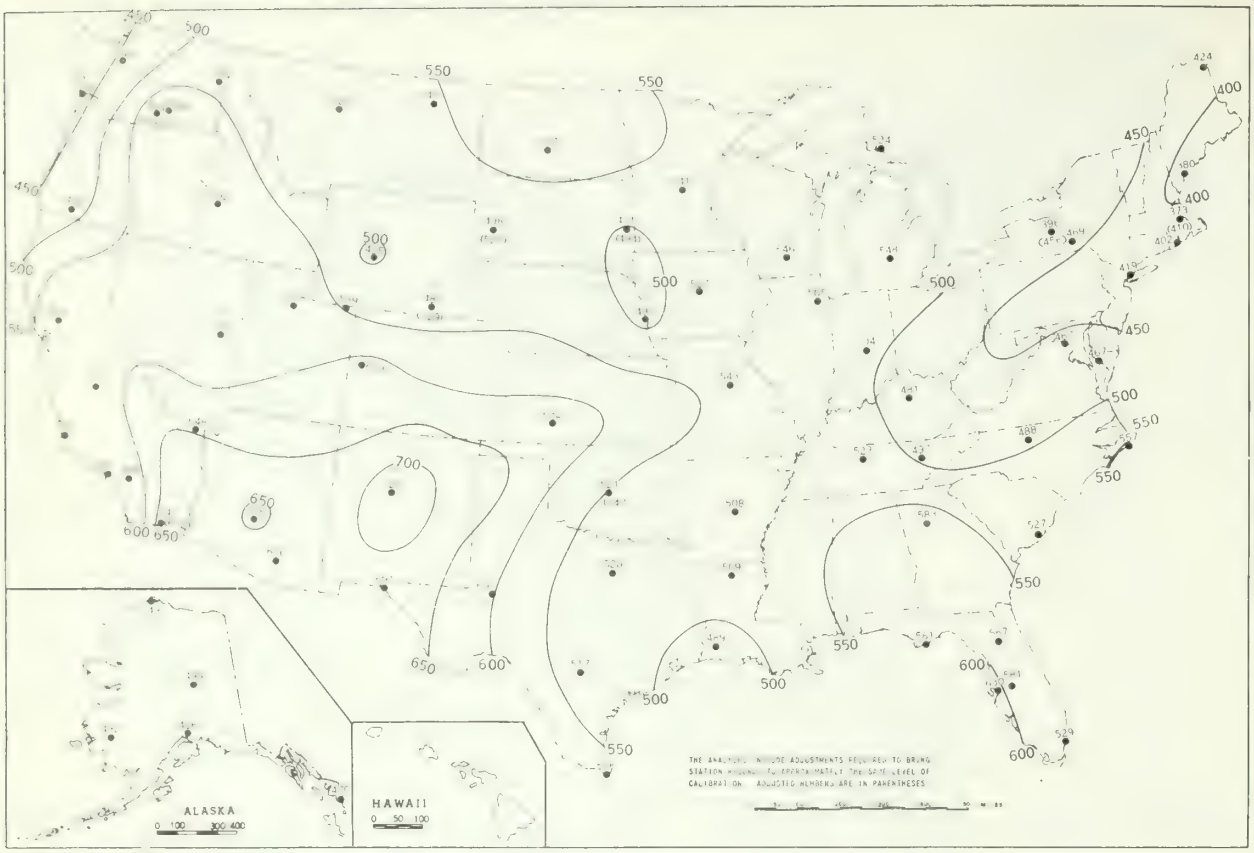

Chart VI. A. Percentage of Possible Sunshine, May 1971.

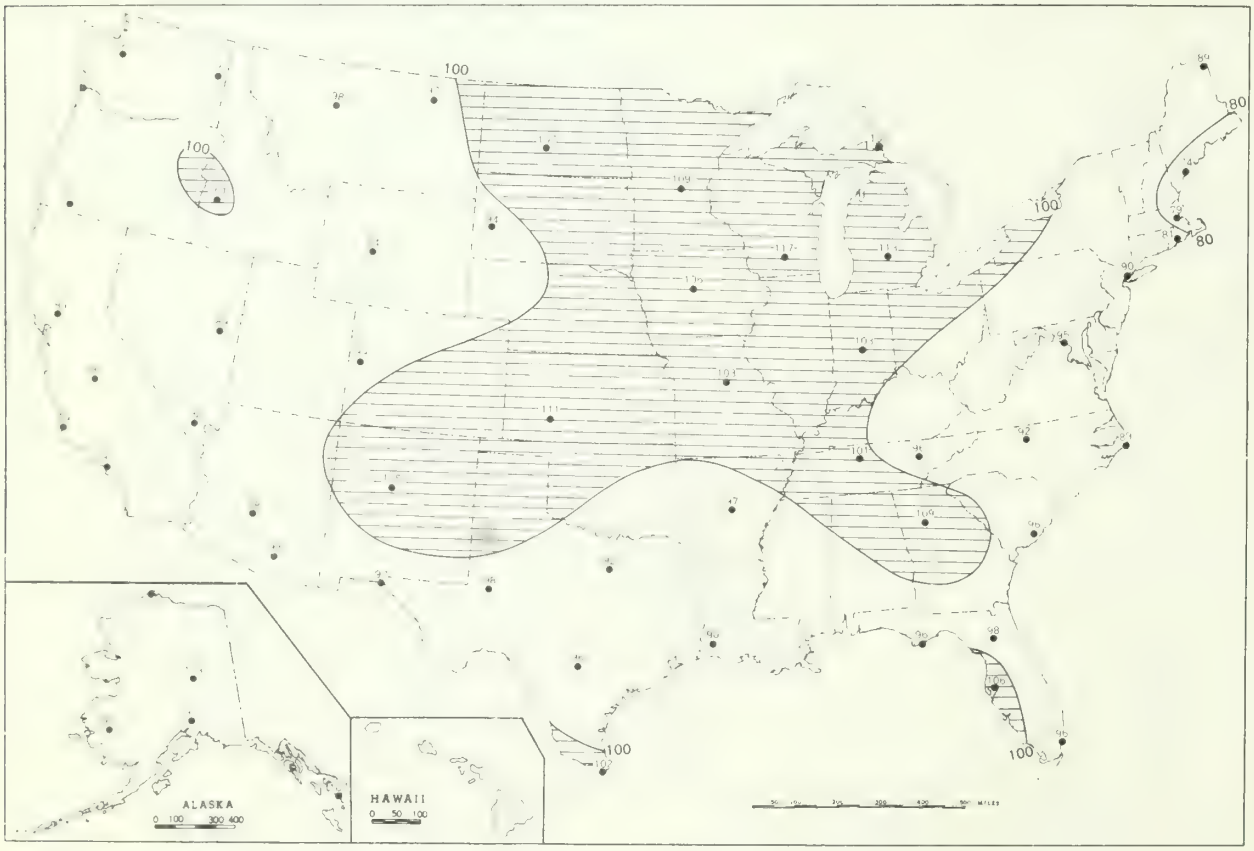
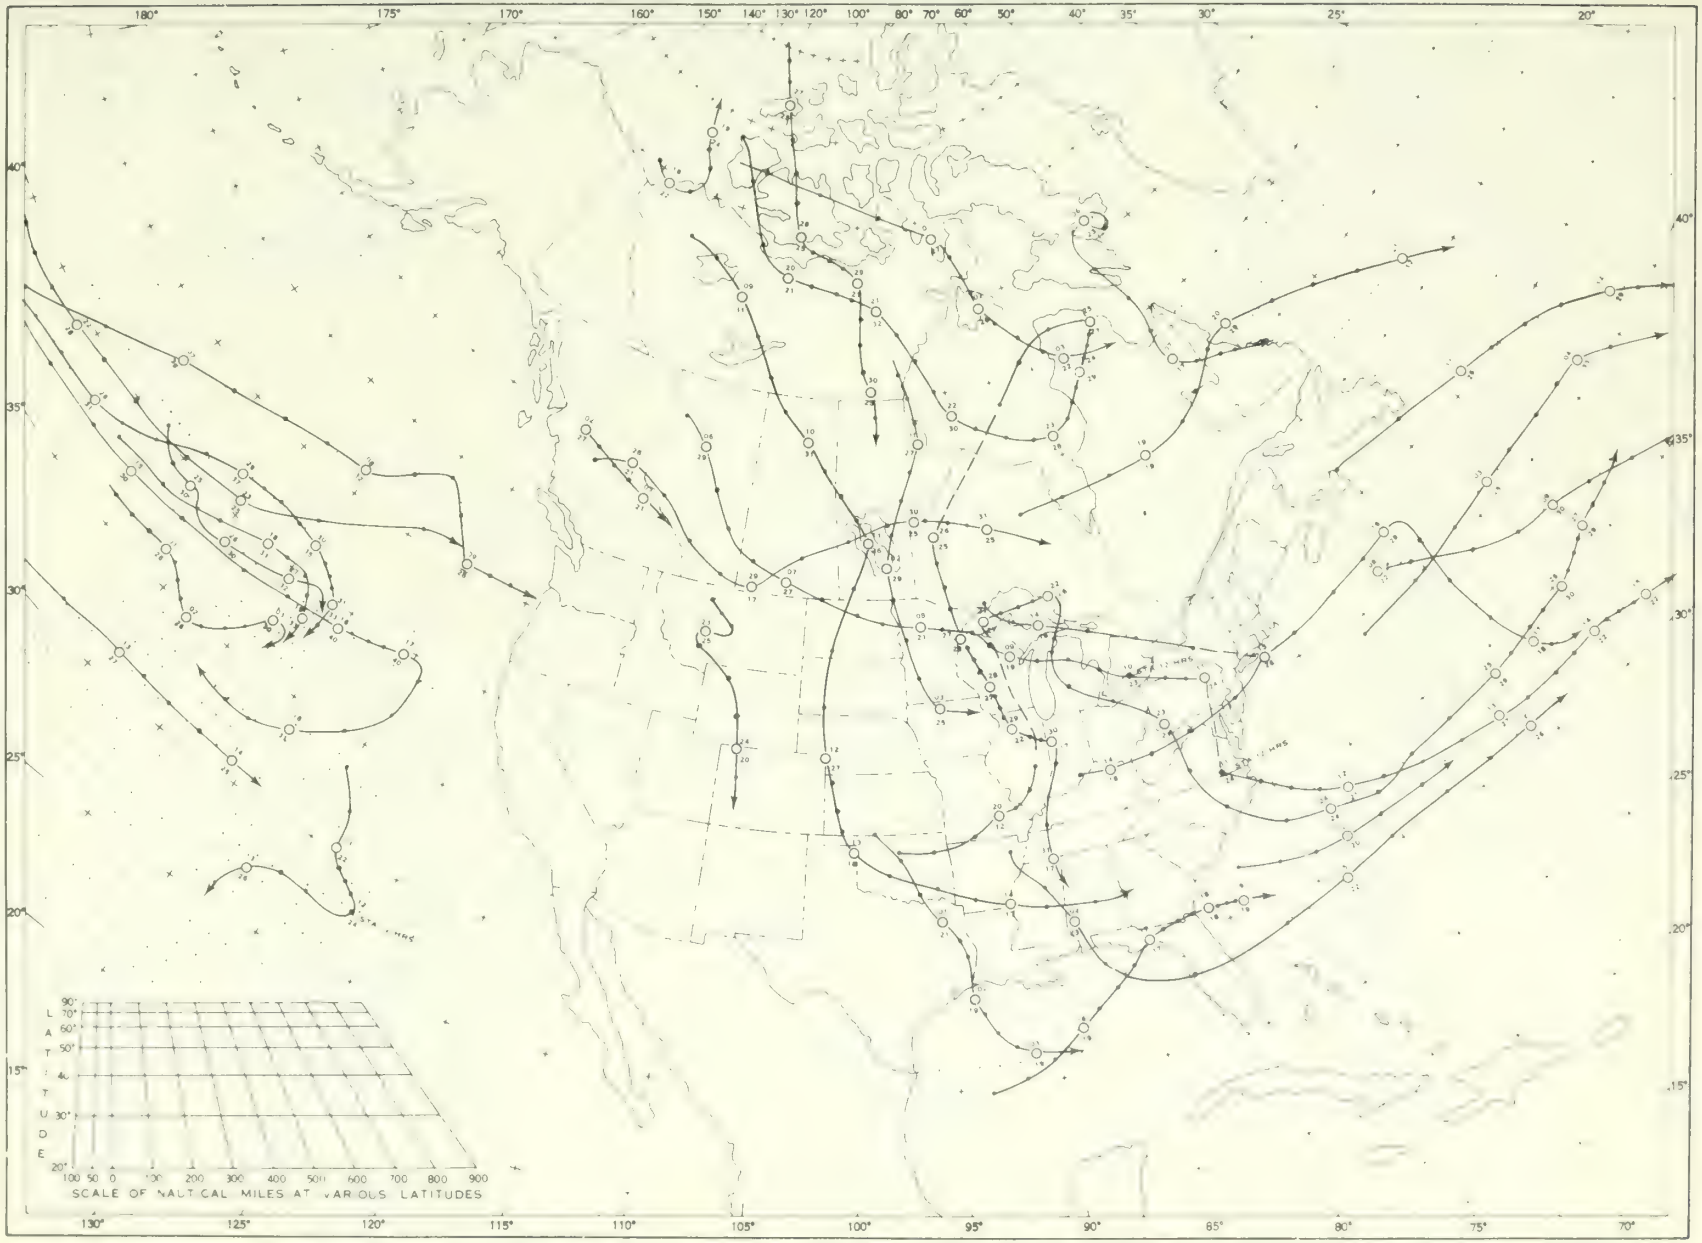
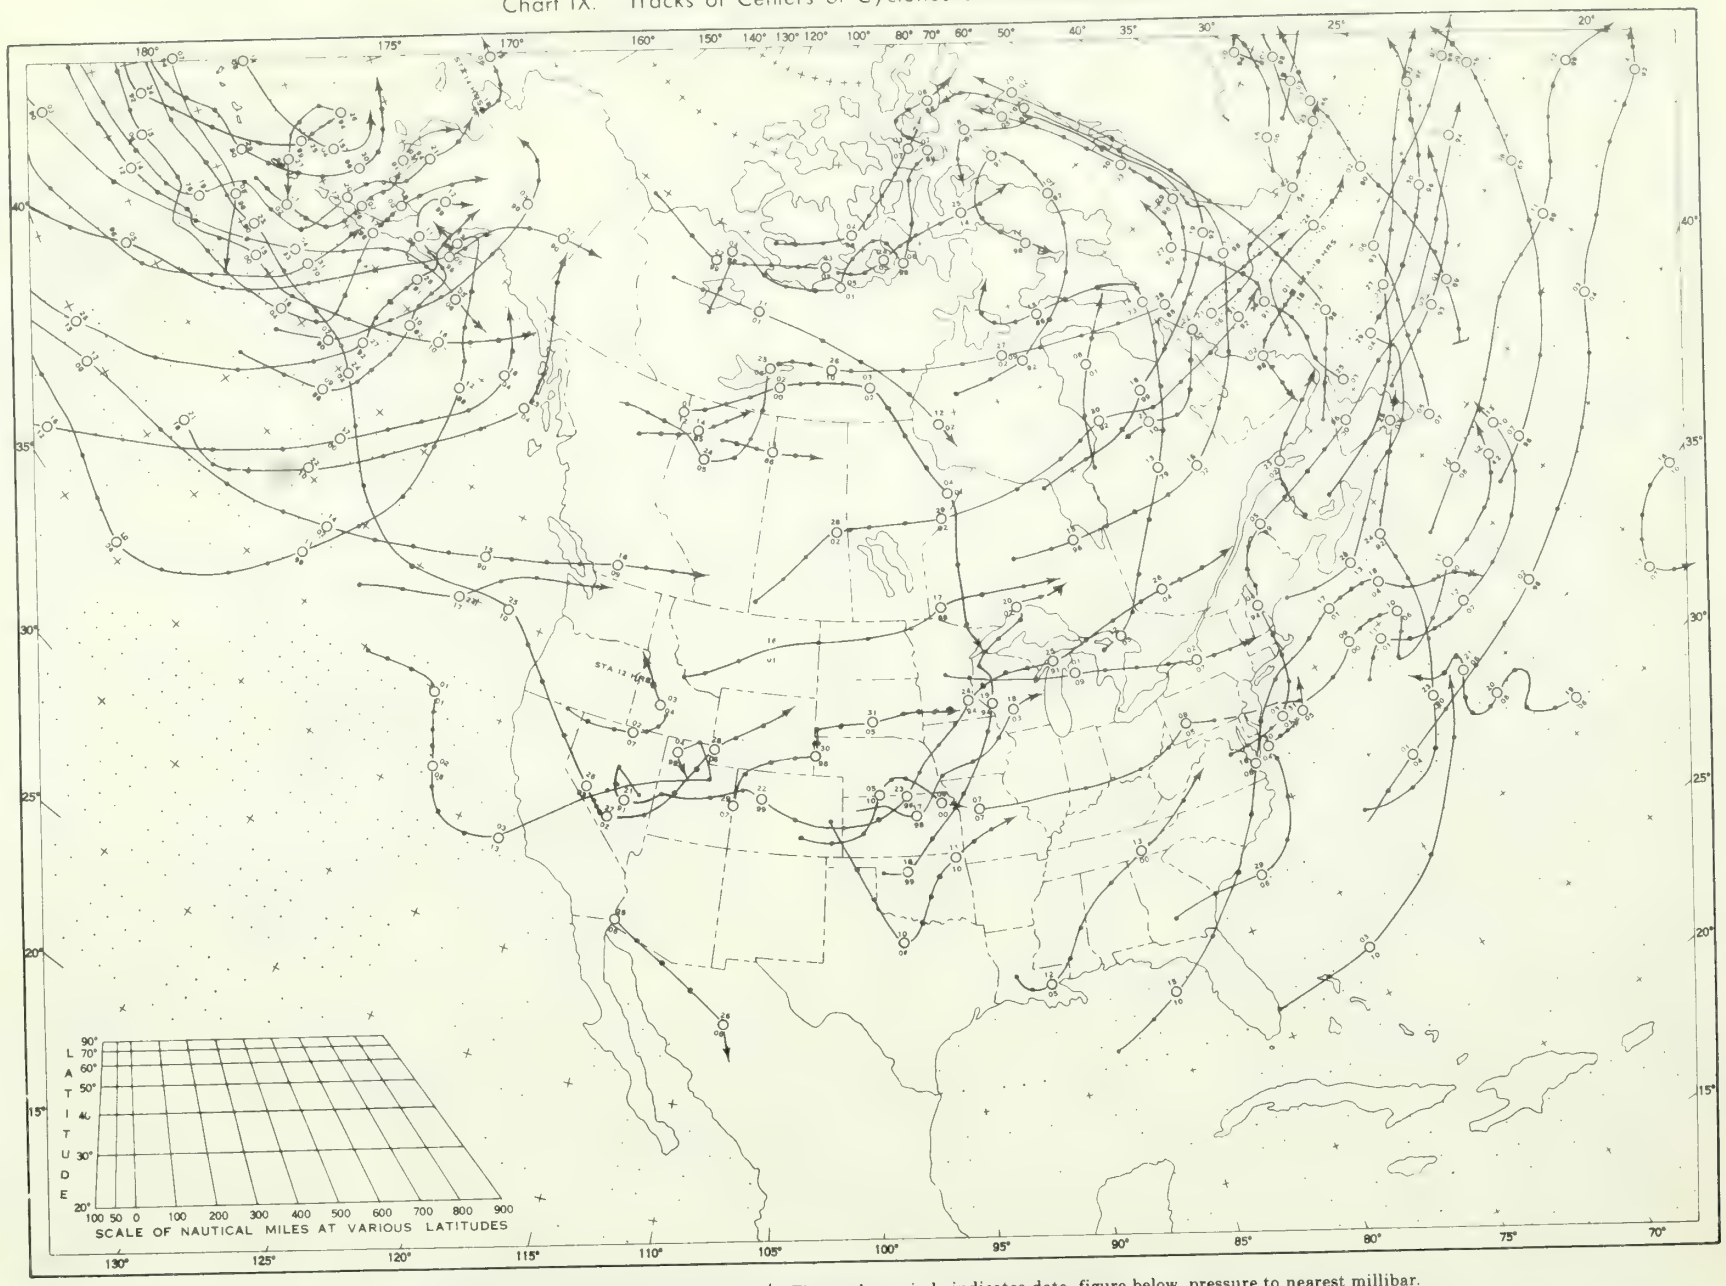


B. Percentage of Mean Monthly Sunshine, May 1971.

A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

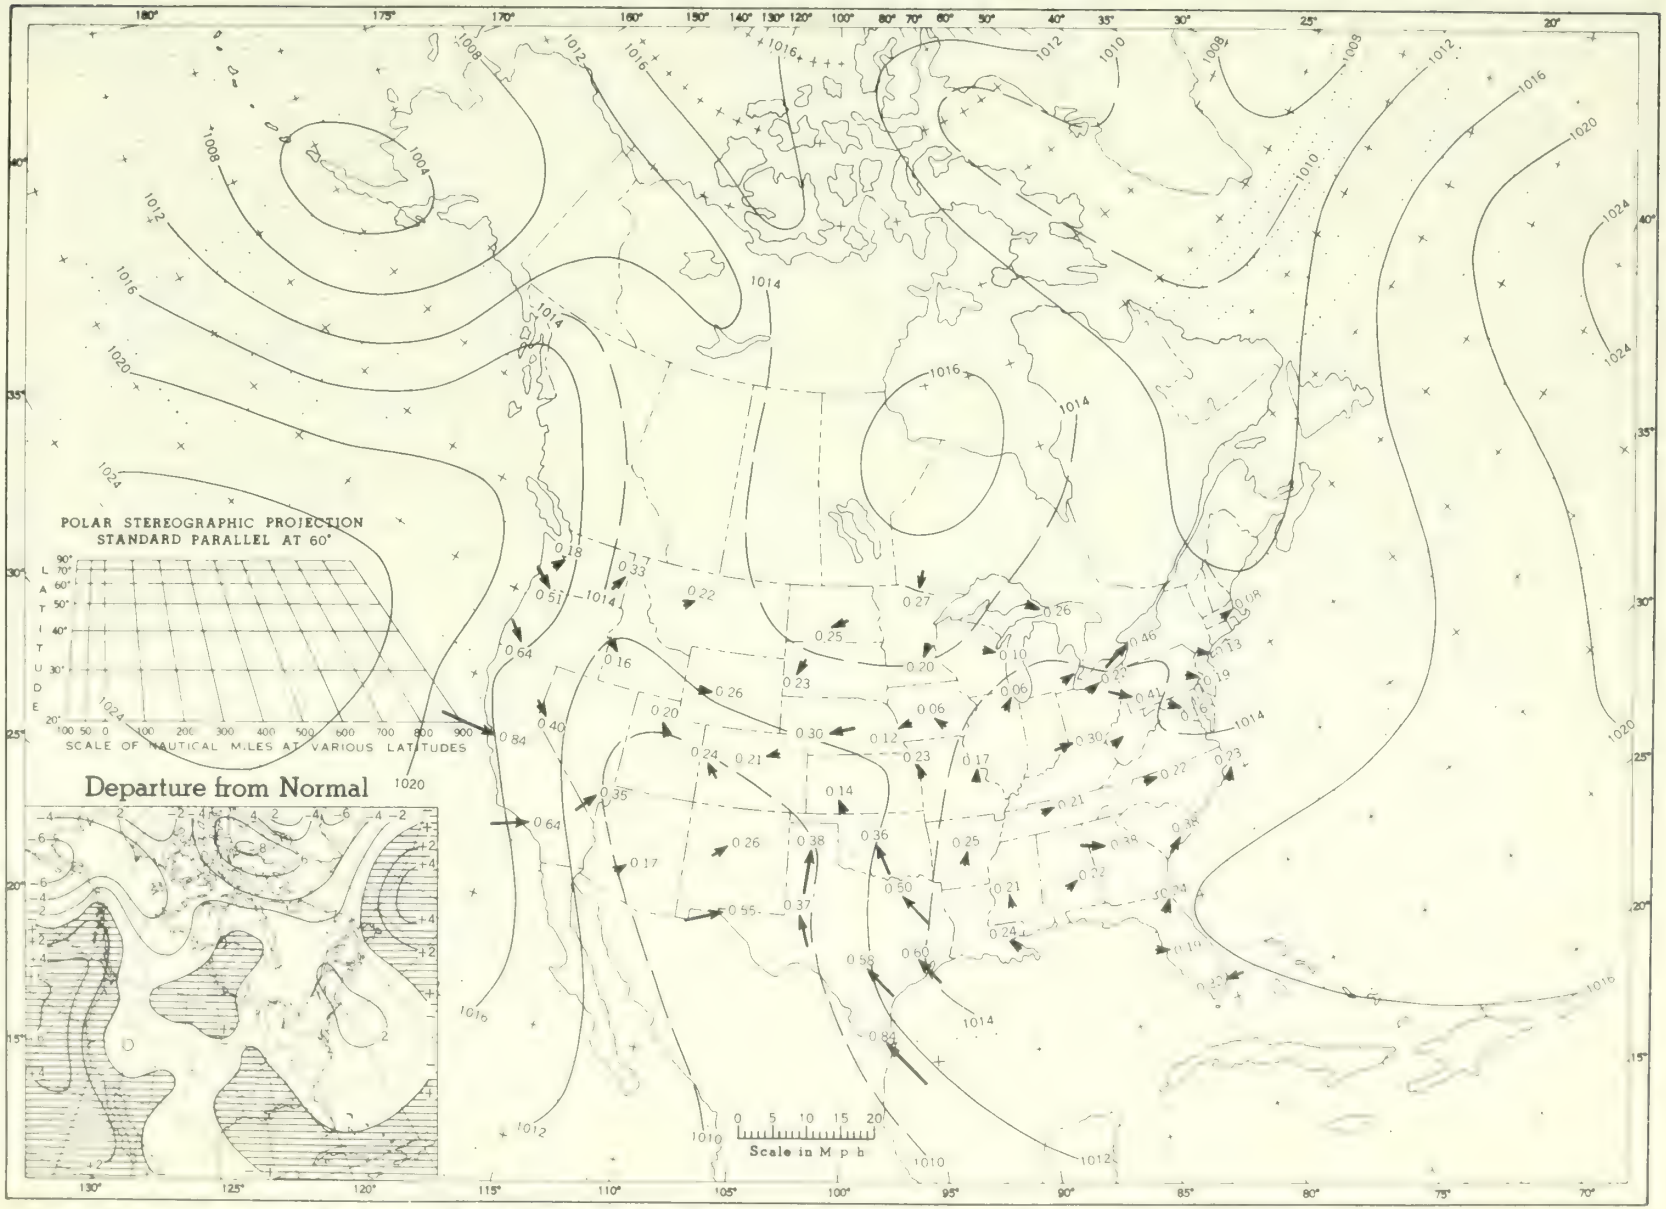


B. Percentage of Mean Daily Solar Radiation, May 1971.



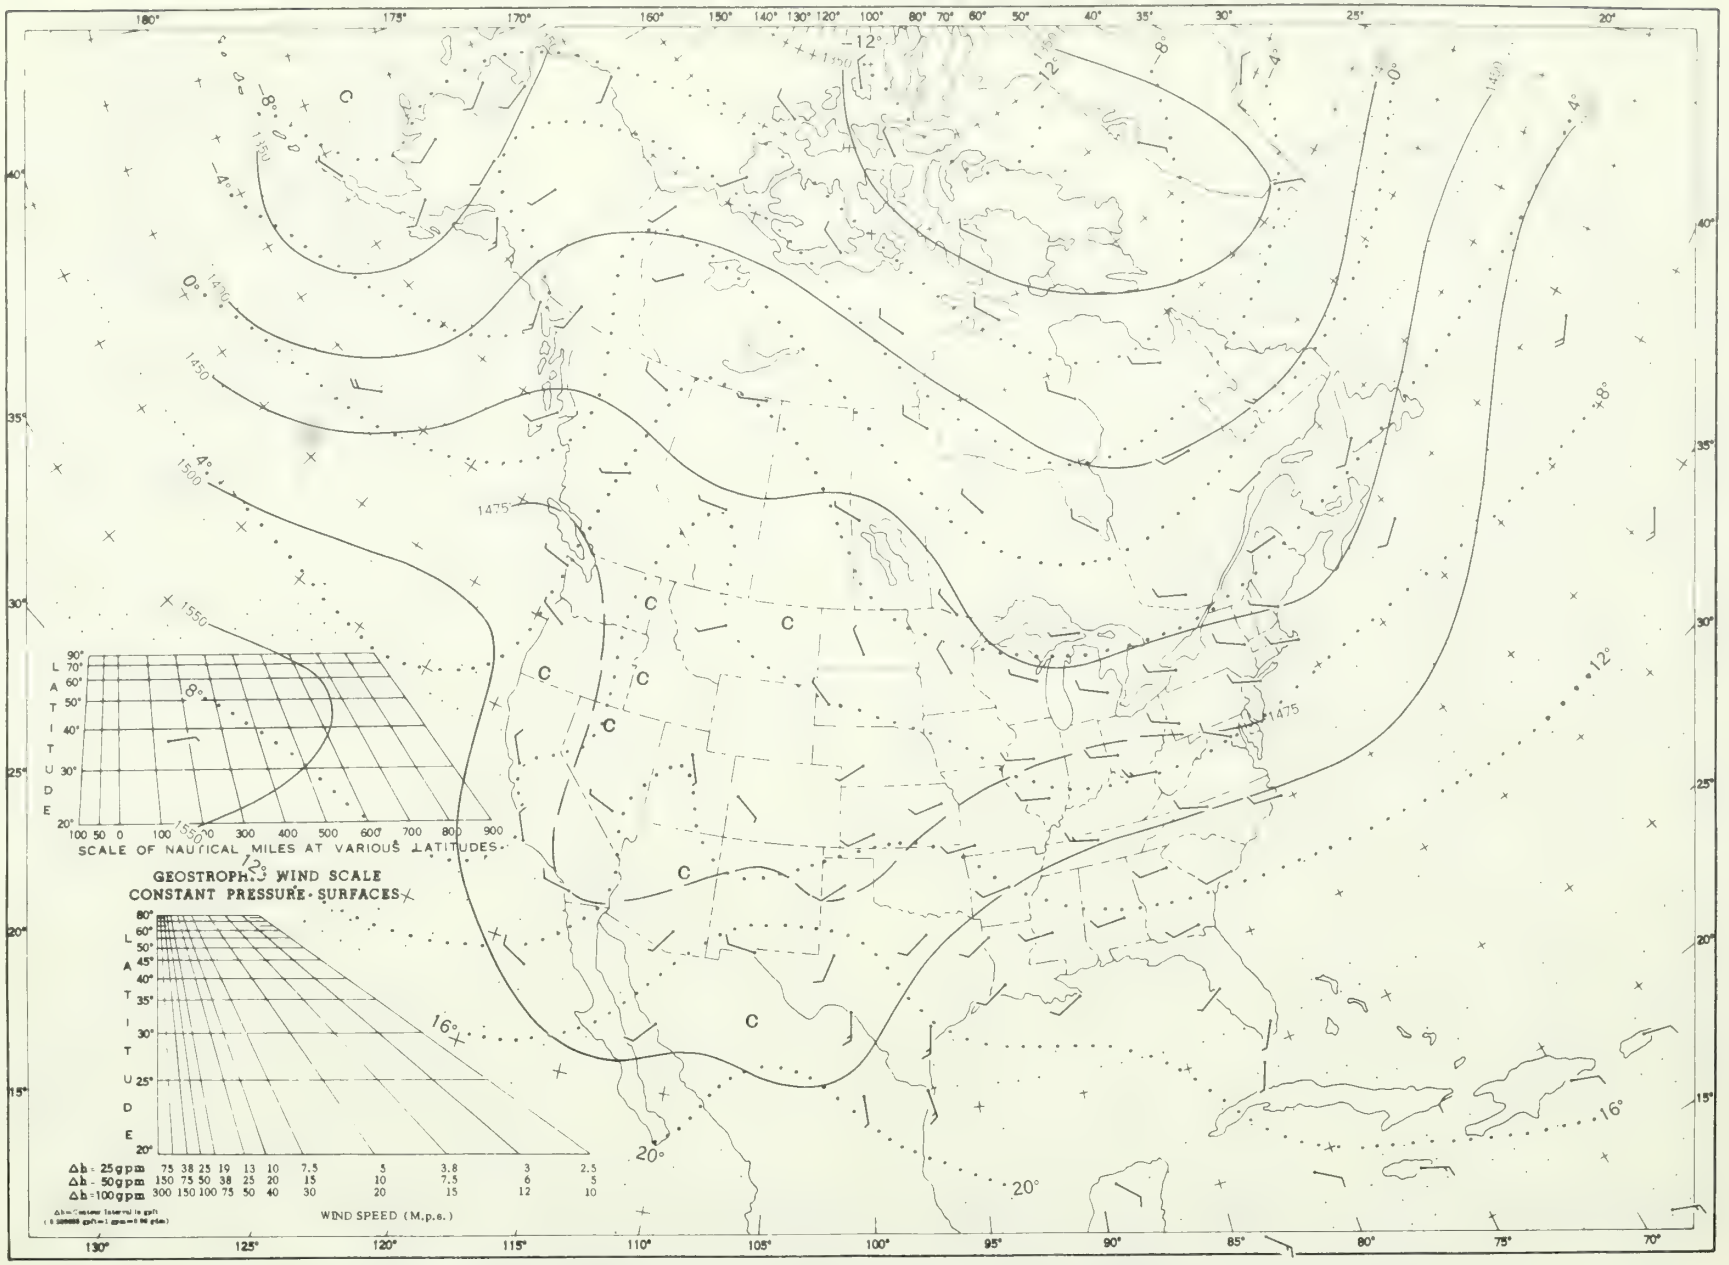
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII Tracks of Centers of Anticyclones at Sea Level, **May 1971.**



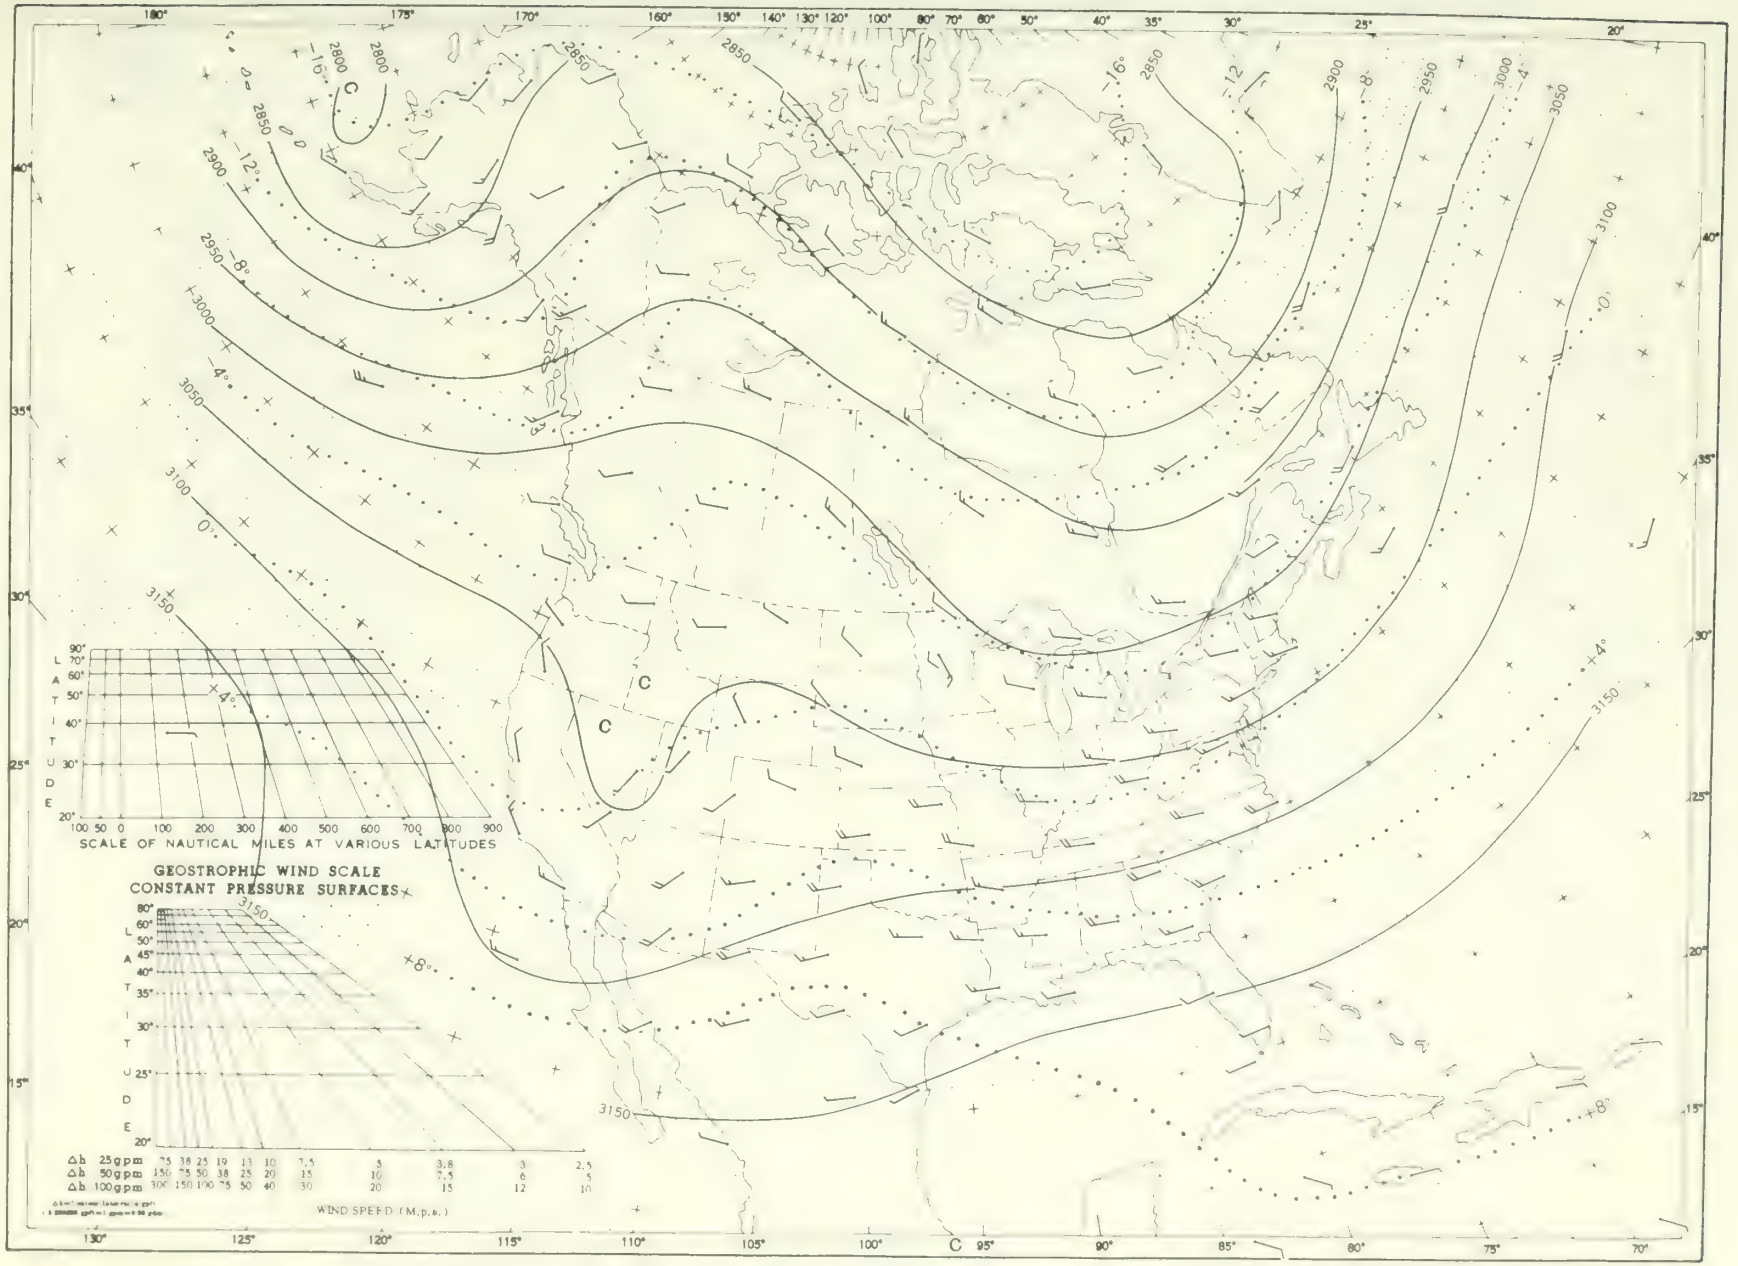
Circle indicates position of center at 7:00 a.m. e.s.t. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, May 1971.



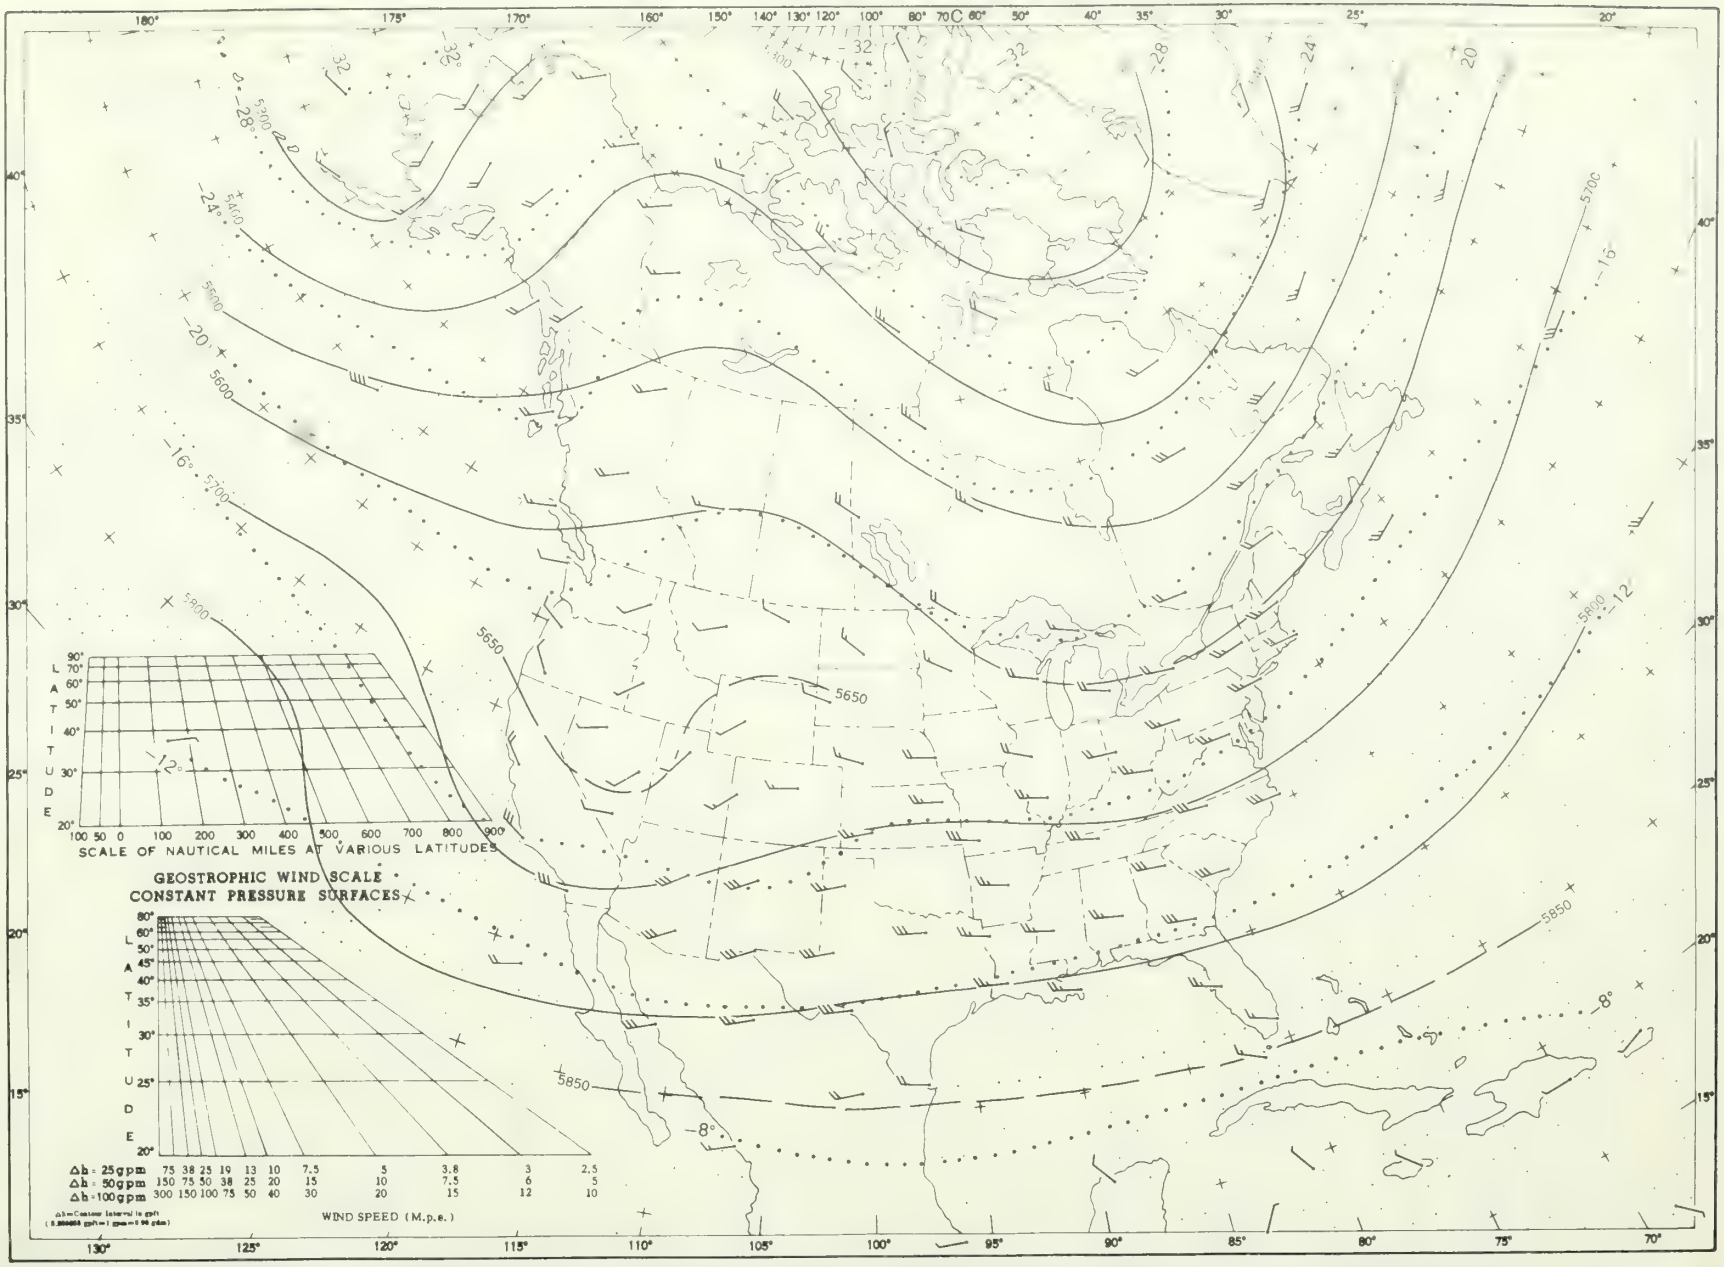
Circle indicates position of center at 7:00 a.m. **e.s.t.** Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X Average Sea Level Pressure (mb) and Resultant Surface Wind, **May 1971.** Inset Departure of Average Pressure (mb) from Normal, **May 1971.**



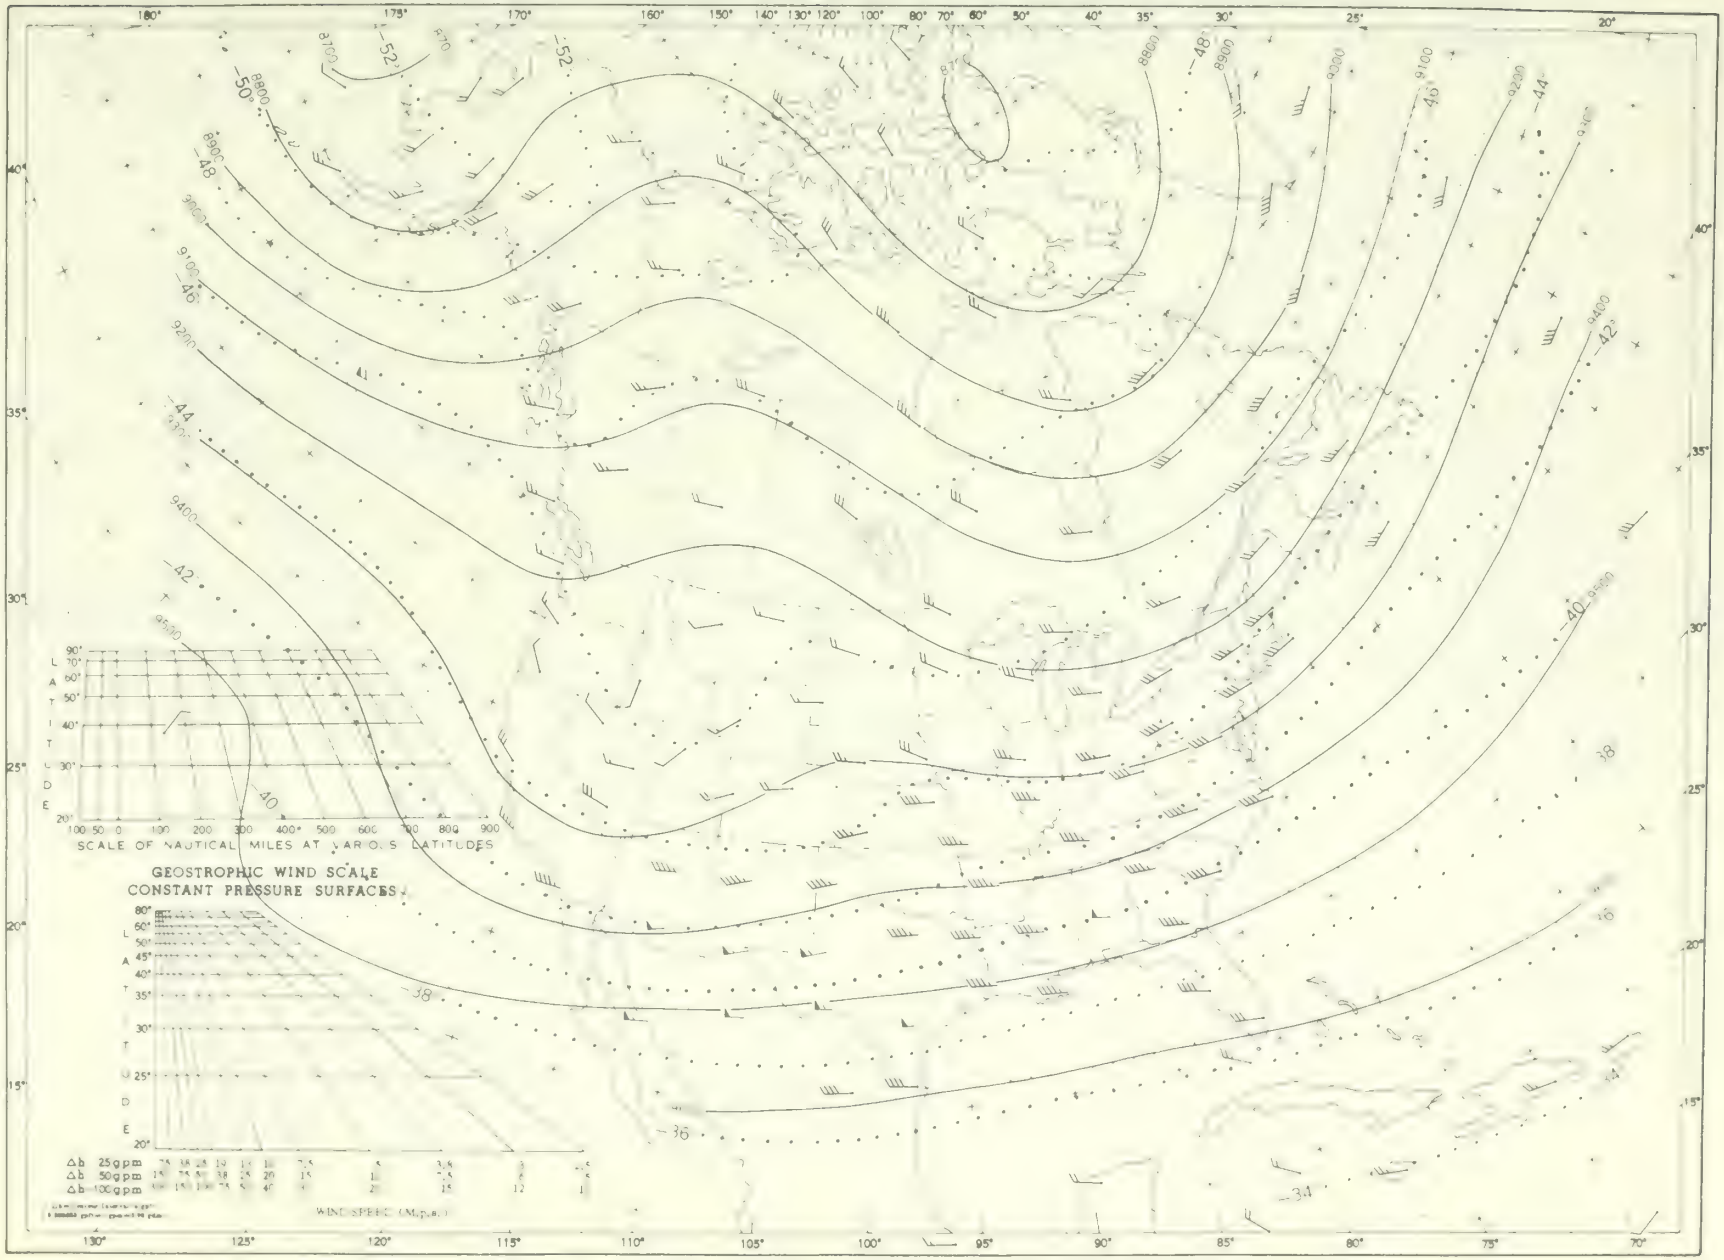
Average sea level pressures are obtained from eight daily 3 hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI 350-mb Surface, 1200 G.m.t., May 1971. Average Height and Temperature, and Resultant Winds



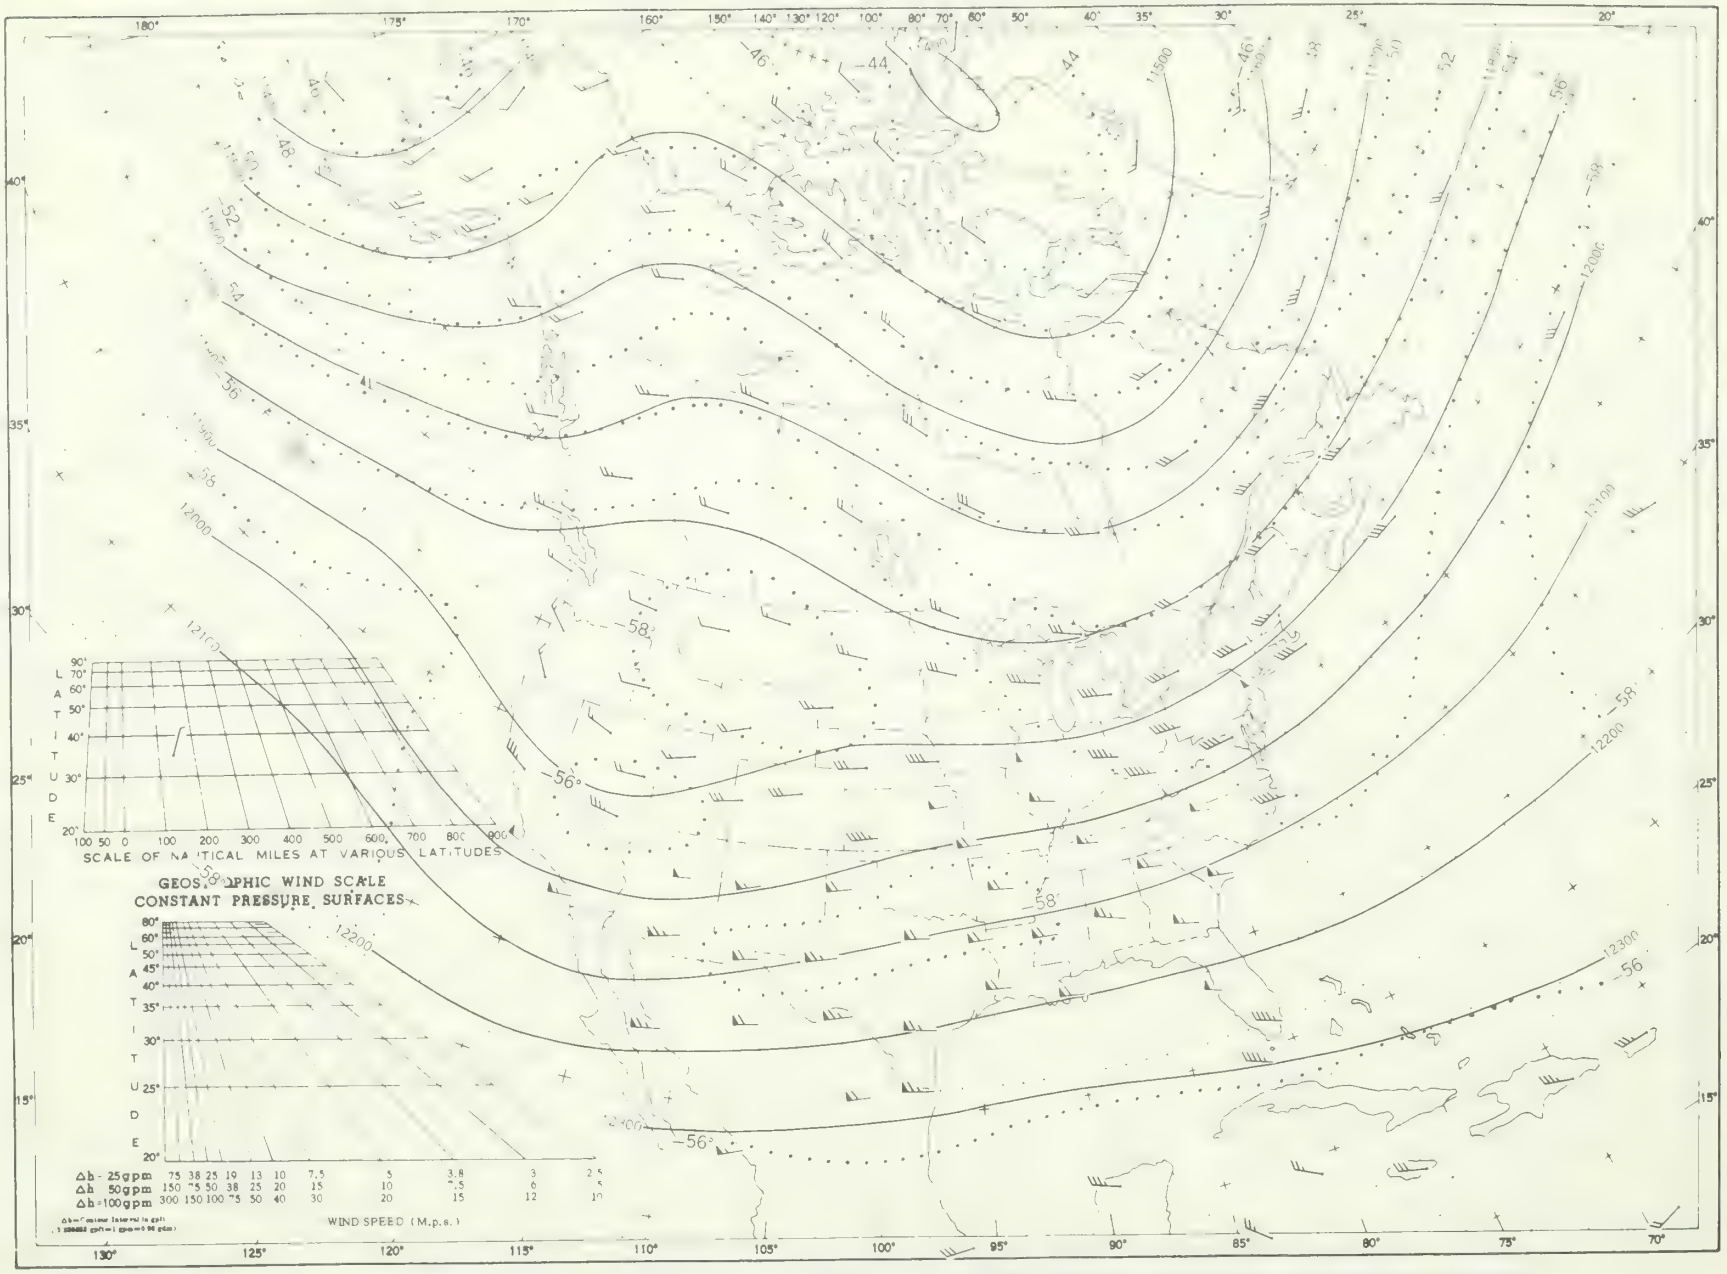
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII 700-mb Surface, 1200 G.m.t., May 1971. Average Height and Temperature, and Resultant Winds



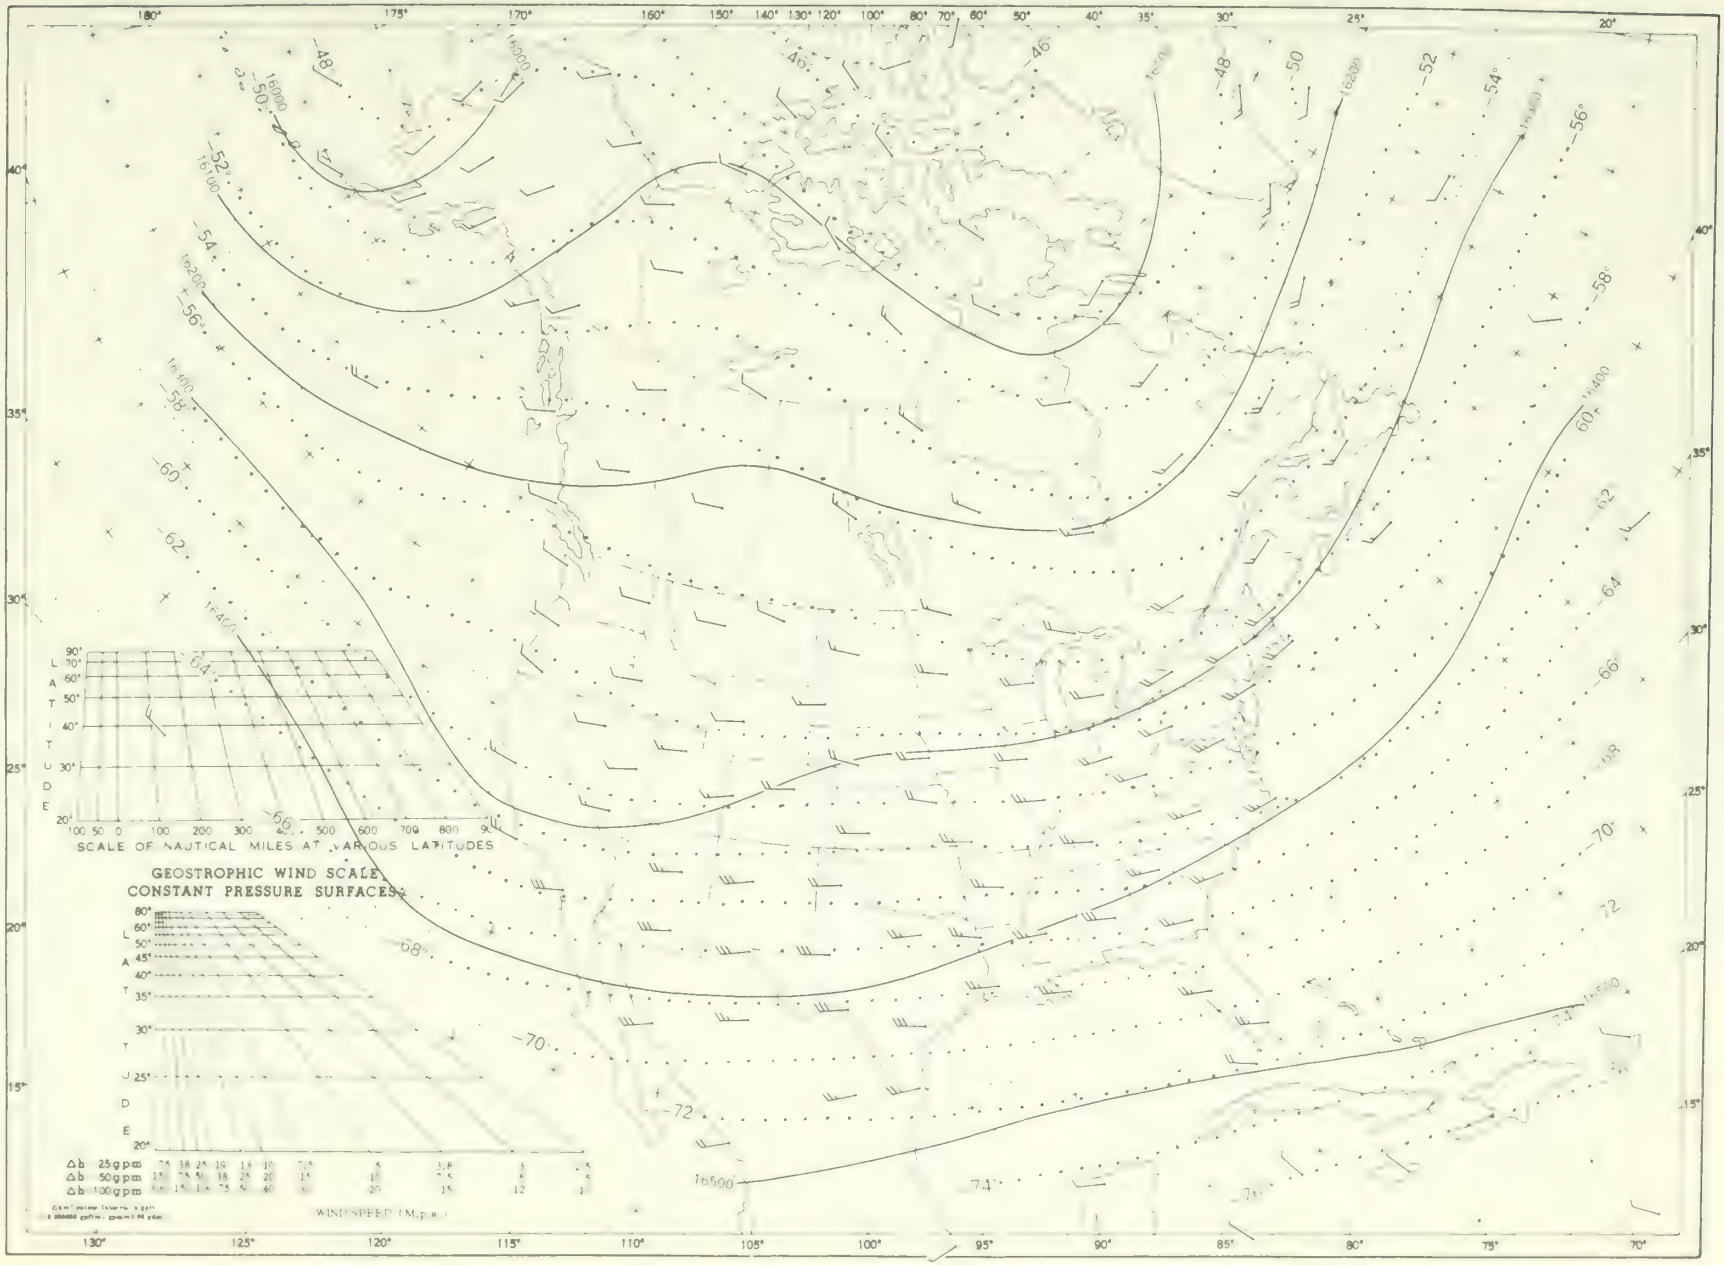
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII 500-mb Surface, 1200 G.m.t., May 1971. Average Height and Temperature, and Resultant Winds



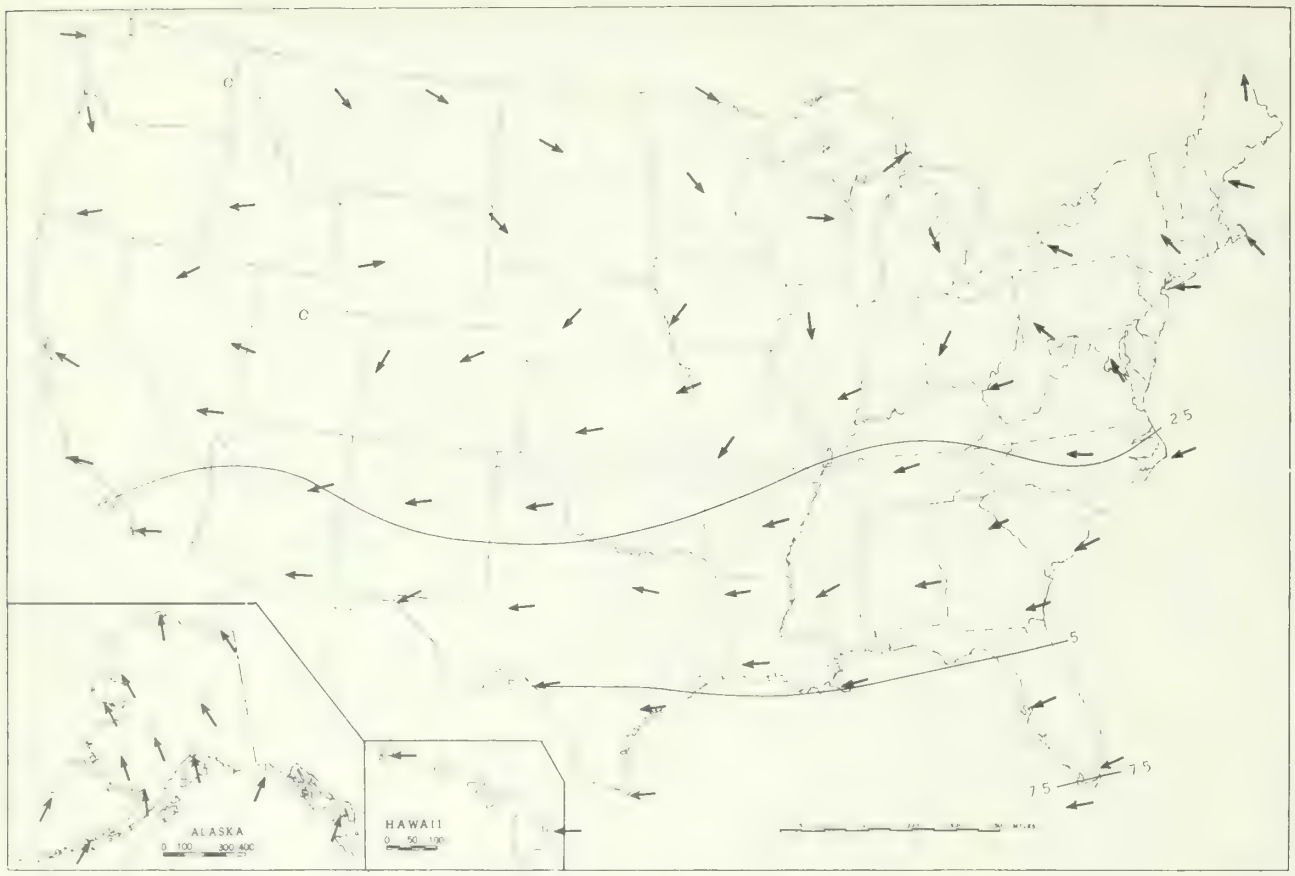
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV 300 mb Surface, 1200 G.m.t., **May 1971.** Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV 200-mb Surface, 1200 G.m.t., May 1971. Average Height and Temperature and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

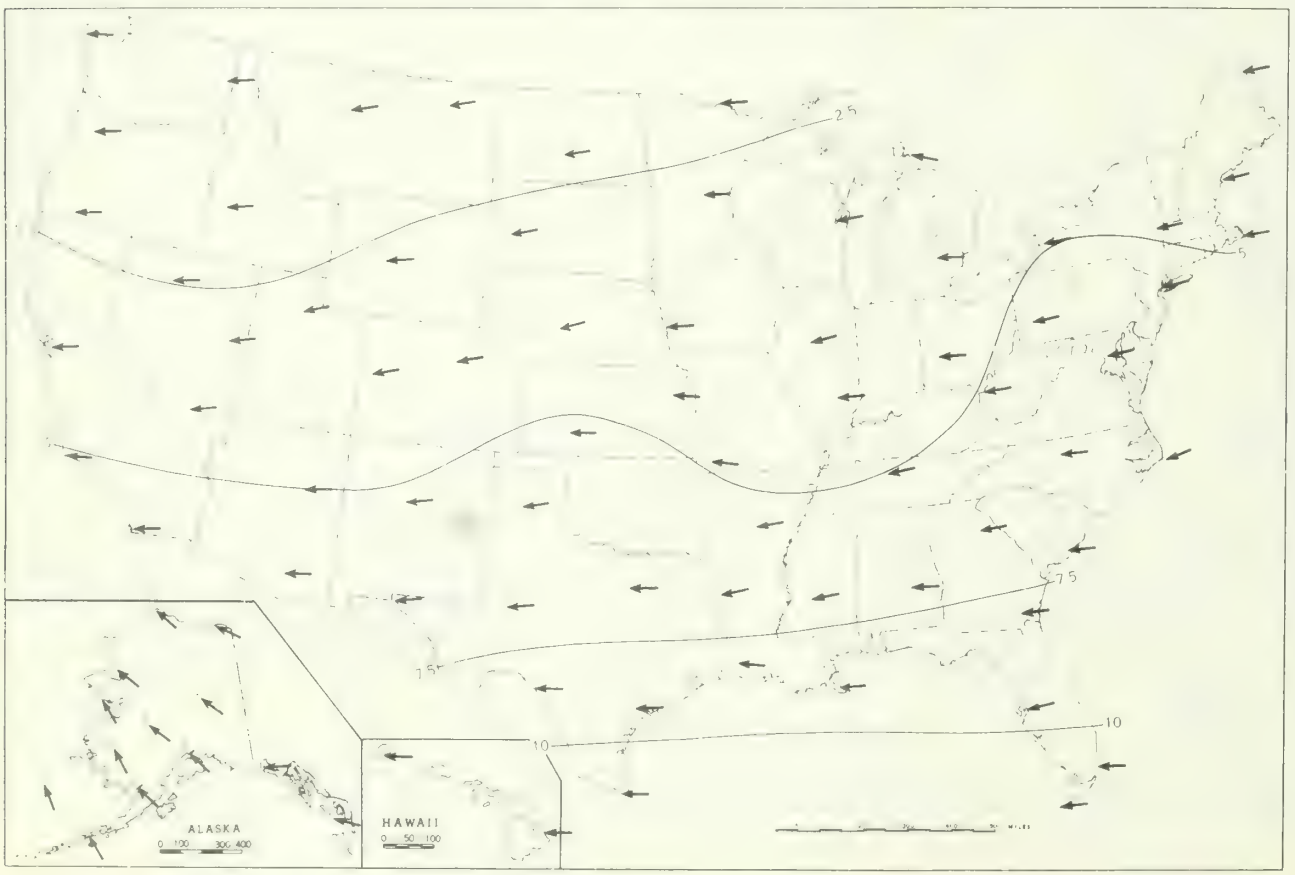


Chart XVI 100 mb Surface, 1200 G.m.t., May 1971. Average Height and Temperature, and Resultant Winds

Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

B. 30-mb. Surface, 1200 G.m.t., May 1971. Resultant Winds.

Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 22 No. 6 JUNE 1971

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. June temperatures averaged warmer than normal over most of the Nation. The exceptions include the Far Northwest and parts of the Southwest.
2. Tornadoes and summer afternoon and evening thunderstorms, typical of any June, were widespread over the central and eastern parts of the Nation.
3. Duststorms occurred in some agriculatural areas that received little or no rain.

TEMPERATURE--June temperatures averaged below normal in the Far Northwest, slightly below normal in the Southwest, and near or above normal over the rest of the Nation. A large area from eastern Nebraska to Lower Michigan and from Minnesota to the Ohio River averaged 3° to 6° warmer than normal.

The Far Northwest averaged slightly cooler than normal throughout the entire month. The Southwest was cooler than normal the first half of June but warmer than normal in the last half. Temperatures in parts of Nevada dropped to the low thirties on one or two mornings early in June. Flagstaff, Ariz., registered 27° on June 2. Midmonth found a warming trend in the Southwest. Temperatures in the interior valleys of California and the southwestern deserts soared to 100° or higher. Blythe, Calif., registered 116° on the afternoon of the 16th. On the 22d, both Needles and Blythe registered 114°.

Subfreezing weather occurred in the Rocky Mountains on several mornings in the first half of June. Leadville, Colo., recorded 29° on June 7. One of the coldest temperatures was 18° at Fraser, Colo., on June 5. In contrast, above-normal temperatures prevailed over the northern and central Great Plains throughout the month and over the southern Great Plains until the last week. Maximums reached the eighties or higher from the Dakotas to the Gulf of Mexico on June 3 and reached 100° or above at a few Texas stations, mostly in the first part of June. Cooler weather came to Texas in the last week of the month. The heat over the central Great Plains was especially intense on June 24 and 26. Russell, Kans., recorded 109° on the 24th and Valentine, Nebr., registered 105° on the 26th. The mercury reached 100° or higher at most Nebraska stations on June 26. The heat spread to the Great Lakes region late in the month. Traverse City and Bay City, both in Michigan, registered 100° on June 27, 28, and 29 and 90-degree weather covered New England on the last day of the month. High relative humidity made the hot weather more oppressive. The Southeast was hot and humid through most of the month. Temperatures were variable but averaged slightly above normal over most of this area.

PRECIPITATION--Summer-type precipitation in June included scattered thunderstorms, some with large hail, strong winds, and torrential rains, and a few tornadoes. Most of the severe weather occurred in the central and southeastern parts of the Nation in the hot, humid air that lay over these areas.

Scattered thundershowers dampened much of the northeast quarter of the Nation early in June. Heavier showers soaked the central Great Plains. Tornadoes and severe thunderstorms occurred in the warm, moist air that covered the central Great Plains and the Mississippi River Valley. Hail from 1 inch in diameter to as large as baseballs pelted some localities. Numerous tornadoes struck mid-United States. A thunderstorm at Hastings, Nebr., was accompanied by hail as large as golf balls and wind gusts reaching 81 m.p.h. A number of tornadoes struck the northern and central Great Plains late June 4. Large hail and heavy thundershowers occurred in northern Illinois June 6 and heavy rains in Pennsylvania and West Virginia sent a number of streams to near bankfull.

Showers and thunderstorms became widespread in the warm, humid air that moved northward over the central and eastern portions of the country in the second week of June. Hail as large as baseballs fell in some spots. Heavy rains from South Dakota to Kansas produced flash flooding along many small streams, substantial rises on several major streams, and saturated adjacent lowlands. Strong winds accompanied some of the thunderstorms. The high winds downed trees and powerlines and tornadoes destroyed buildings at scattered locations. Although the storms were most severe from the Dakotas and Minnesota to Texas, the thunderstorm activity was widespread from the central and southern Great Plains to the Southern Atlantic Coastal States. Hail as large as baseballs caused glass damage at Frankfurt, Ind., June 12. On the same day, hail accumulated to 6 inches in depth 12 miles north of Sidney, Nebr., and heavy rains flooded highways 10 miles east of Sidney.

Summer thunderstorms continued over much of the middle United States in the last half of June. Hail, high winds, and torrential rains accompanied some of the thunderstorms. Evansville, Ind., received 1.65 inches of rain in about 20 minutes on the afternoon of June 15. Rain of this intensity falls in streams instead of drops. It is sometimes referred to as a "cloudburst." Many of the June thunderstorms occurred in the afternoons and evenings and became less intense and more scattered in the early mornings.

Duststorms occurred in some agricultural areas that received little or no rain. The dust in some of the storms reduced the visibility to less than 200 yards.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day-data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70° F. or above for Alaskan Stations.
Y Peak Gust.
· And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

CLIMATOLOGICAL DATA

METRIC UNITS

JUNE 1971

State and Station	Elevation (ground)	Pressure: Station	Pressure: Sea level	Temperature: Average maximum	Temperature: Average minimum	Temperature: Average	Temperature: Departure from normal	Temperature: Highest	Temperature: Date	Temperature: Lowest	Temperature: Date	Temperature: No. of days: Max 32.2 °C or above	Temperature: No. of days: Min 0 °C or lower	Temperature: Average dew point	Average relative humidity	Precipitation: Total	Precipitation: Departure from normal	Precipitation: Greatest in 24 hours	Precipitation: No. of days: 25 mm or more	Precipitation: No. of days: With thunderstorms	Precipitation: Snow, Ice pellets: Total	Precipitation: Snow, Ice pellets: Maximum depth on ground	Wind: Resultant speed	Wind: Resultant direction	Wind: Fastest mile (1.6 kilometers): Speed	Wind: Fastest mile (1.6 kilometers): Direction	Wind: Fastest mile (1.6 kilometers): Date	No. of days (sunrise to sunset): Clear, 0-3	No. of days (sunrise to sunset): Partly cloudy, 4-7	No. of days (sunrise to sunset): Cloudy, 8-10	Sky cover, tenths (sunrise to sunset)	Possible sunshine

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

† Includes crop damage.
° Crop damage.
* No occurrence of storms or unusual weather phenomena reported.
‡ Includes heavy sleet storm.
Freezing drizzle and freezing rain, commonly known as glaze.
Ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
† Storm damages are placed in categories varying from 1 to 9 as follows:

1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5 Million
7 $5 Million to $50 Million
8 $50 Million to $500 Million
9 $500 Million to $5 Billion.

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS
JUNE 1971

Elmer R. Nelson, Office of Hydrology

Extensive flooding occurred along the Nueces River from below Crystal City, Tex., to below Cotulla, Tex., during the latter part of June. Major flooding occurred at Cotulla with a crest on July 1 ranking as the third highest of record.

Moderate to severe flooding occurred in the Shenandoah Basin in Virginia and West Virginia during the latter part of May and the first part of June.

Serious flooding occurred during June in Alaska on the lower Yukon, Kuskokwim, and Kobuk Rivers due to ice jams and greater than normal snowpack.

ATLANTIC SLOPE DRAINAGE

Precipitation for June in the Delaware River Basin above Trenton, N. J., averaged around 2.2 inches, or about 65 percent of normal. In the Delaware River Basin below Trenton and in central and southern New Jersey, precipitation averaged about 1.5 inches, or about 41 percent of normal. In northern New Jersey, precipitation averaged around 1.8 inches or 44 percent of normal. Many stations in southeastern Pennsylvania and southern New Jersey recorded less than 1 inch of rainfall. Only a few stations reported over 3 inches of precipitation and these were in the lower Lehigh River Valley. All major water supply reservoirs in New Jersey dropped to below capacity during June. By the end of the month, reservoirs were down to 93 percent of capacity, a loss of almost 6 billion gallons. New York City's three reservoirs on the upper Delaware River lost 29 billion gallons during June and were 89 percent of capacity by the end of the month.

The flooding in the Shenandoah Basin in Virginia on May 29 to June 4 was due to 3 to 5 inches of rain. The runoff was high as the soil was saturated due to a wet May. There were periods of very heavy rain, where 1 inch of rain fell in 1 hour, with nearly all of it runoff. The overflows began as flash floods in the headwaters of the Shenandoah River. General flooding developed along the entire river. The flooding along the South Fork of the Shenandoah was moderate to severe. The stages in the lower Shenandoah were the highest since 1955. The storm, centered over the Shenandoah Valley, moved downstream through the basin and contributed to higher crest stages. No large population centers were seriously affected by the flooding of the Shenandoah River or its tributaries. Damage was predominantly confined to resort areas, riverside and mobile homes, highways and agricultural bottom land. The Corps of Engineers estimated the flood damages throughout the basin at approximately $750,000 to $1 million.

The flooding in eastern North Carolina during June was due to the heavy rains that occurred during the latter part of May. The Roanoke River at Randolph, Va., which crested nearly 3 feet above flood stage on May 31, receded within its banks on June 1. Kerr Reservoir continued at a rather high level during most of June. Regulated releases prevented any flooding of consequence downstream. At Williamston, N. C., the stage remained from bankfull to 1 foot above from May 24 to June 24. Minor flooding occurred along the upper Neuse River during the first 2 days of June. A local downpour of around 1 inch caused street flooding in Greensboro, N. C., during the afternoon of the 23d.

EAST GULF OF MEXICO DRAINAGE

The Pearl River which went above flood stage at Bogalusa, La., on May 9 receded within its banks on June 2. Downstream at Pearl River, La., the Pearl River continued above flood stage from May 15 to June 4. By the middle of June, farming and timber cutting operations were almost back to normal. The flood damage during June was minimal in comparison to May when it was estimated by the Corps of Engineers to be $1.2 million.

MISSISSIPPI SYSTEM

Upper Mississippi Basin--Very heavy rains during the night of the 10th in the Franklin-Fairfax area along the Minnesota River in south-central Minnesota caused flooding along small streams and creeks in the area. Rainfall amounts from 4 to near 11 inches (Franklin) were reported in this area. This is the third known occurrence in Minnesota of 24-hour rainfall exceeding 10 inches. The two previous occurrences were June 16, 1957, in the Marshall area and May 20, 1960, in and around Jordan. These heavy rains resulted in loss of livestock, bridge and road damage, and washouts and damage to a State Park Recreational area. Additional information on the Franklin 10-inch-plus rainfall will be found in the June 1971 issues of Storm Data and Minnesota Climatological Data.

Locally heavy rains in northeastern Iowa on June 20 caused the Turkey River at Garber, Iowa, to overflow. No damage resulted. Slow moving thunderstorms in east-central Iowa late on the 24th and early on the 25th produced rainfall amounts in excess of 3 inches causing the Wapsipinicon and Maquoketa Rivers to overflow. Damage was negligible.

Heavy rains in the upper reaches of the Raccoon River on the 6th caused minor flooding at Van Meter, Iowa, on the 7th. The precipitation totalled about 4.5 inches in about 6 hours. No damage was reported.

Missouri Basin--Snowmelt runoff in the upper Missouri Basin in Montana kept river levels high but below flood stage during June, except during periods following moderate or heavy rainfall. Levels in the headwater areas rose above flood stage four times. Only minor lowland flooding occurred each time causing little damage. The Gallatin River near Gateway, Mont., rose to its highest stage, 33.45 feet, since 1957. The old record set last year was 33.35 feet. Flooding along the Yellowstone River was confined to pasture and haylands. No major losses were reported.

Prolonged thunderstorm activity from the 4th through the 10th caused flooding on the Floyd River and its tributaries in northwestern Iowa. Some areas received 6 to 8 inches of rain during the 7-day period. The first flood crest was due to rainfall amounts ranging up to 4 inches on the 4th-5th in northwest Iowa, southeast South Dakota, and southwest Minnesota. Additional rainfall of 2 to 3 inches in the same area caused a second crest. Lowland flooding occurred on the West Branch of the Floyd River at Struble, Iowa, on the 10th. The Rock River at Rock Valley, Iowa, crested near bankfull on the 8th and 10th. The Big Sioux River at Akron, Iowa, crested 0.3 foot below flood stage on the 11th. Brazile Creek at Niobrara, Nebr., ran a little over bankfull stage on the 10th-11th. The major damage was to drowning of corn crops from the prolonged flooding created by several rises. Other damages were to fences, sheds, and small farmstead bridges and dikes. The damages were estimated at $135,000.

Snowmelt from the higher elevations of the Rocky

Mountains and rainfall from storm systems moving across the Platte River Basin in Nebraska kept the Platte River above flood stage near Grand Island, Nebr., from May 5 to July 1. The North Platte River at North Platte, Nebr., continued above flood level from May 12 through June 29.

Heavy general rains beginning during the evening of the 9th and ending on the early morning of the 11th caused flooding on Lyon Creek in the lower Smoky Hill River Basin. The crest near Woodbine, Kans., on the 10th was 9.5 feet above flood stage. Damage was relatively minor and confined to agricultural overflows.

Heavy rains over the headwaters of the Missouri Basin on the 25th-26th with lighter amounts on the 27th-28th caused flooding along the main stem of the Missouri at Toston, Mont., on the 28th-29th. The crest on the 28th was 0.3 foot above flood stage. Snowmelt runoff throughout the month kept the river levels high. Runoff from the Big Sioux and Floyd Rivers in Iowa, and the Platte River in Nebraska, caused near bankfull stages in the reach below Sioux City, Iowa, to the mouth of the Platte River from the 8th to the 18th. Considerable flooding occurred along the main stem of the Missouri below the mouth of the Platte River during this period. Many acres of lowland and cropland were flooded from the mouth of the Platte River southward into Kansas and Missouri. Some lowland flooding occurred from Lexington to Waverly, Mo. County Extension Agents in Nebraska, Iowa, and northwest Missouri indicated much of the crops were lost through seepage from high underground water levels. Preliminary damages were estimated at $1 million.

Ohio Basin--Severe flash flooding occurred on Ten Mile Creek at Wallace, W. Va., on the 5th. The Corps of Engineers reported the stage of Ten Mile Creek to be the flood of record at Wallace, W. Va., exceeding the 1963 flood. Further downstream below Dallas, W. Va., the crest was 3 feet or more below the 1963 flood. This flooding was due to 5 to 7 inches of rain that occurred in a 3-hour period. Thousands of dollars' worth of damage was reported. Thirty to 40 families sustained losses and were helped by the Red Cross.

Major flash flooding occurred on Slate, Jack, and Brush Creeks in Westmoreland County southeast of Pittsburgh, Pa. During the evening of the 13th storm totals of 5 inches occurred around Jeannette, Pa. in a period of 1 to 1-1/2 hours. About 250 to 300 homes were affected by the high water. Damage was estimated at several hundred thousand dollars.

Some flooding of small creeks occurred in the vicinity of Waterloo, Ohio, during the evening of the 13th. Little or no damage occurred. A flash flood occurred on Federal Creek near Lawrence-Gallia County border in West Virginia during the evening of the 13th. Several cars were flooded and a bridge was washed out. Locally heavy rain caused some flash flooding of small creeks in the vicinity of Waterloo and Jackson, Ohio, during the afternoon of the 14th. Considerable damage resulted from the flash flood in the vicinity of Pikeville, Ky., during the afternoon and evening of the 14th. The weather station at Pikeville, Ky., reported 2.26 inches of precipitation. During the afternoon of the 16th, a thunderstorm in East Rainelle, W. Va., caused some flooding of a small creek that flows through the Bellwood area. No estimate of damage is available. A flash flood occurred in eastern Pulaski County in Virginia during the night of the 22d or the morning of the 23d. Most of the flooding occurred between Dublin and Parrott, Va.

Intermittent, heavy thundershowers caused flooding on the Little Wabash at Wilcox, Ill., on the 16th-17th and 20th-22d. Local storm totals of over 3 inches were recorded in less than 2 hours. In the vicinity of Evansville, Ind., 1.77 inches of rain was reported on the 15th. Over 4 inches was reported on the 19th from the area just west of Evansville, Ind. The total rainfall at Evansville, Ind., during the month was 6.89 inches which is the third greatest total on record for the month of June.

Localized flash flooding occurred in Asheville, N. C., on the 19th due to a severe thundershower. Three to 4 inches of rain occurred in about 1 hour in a low lying area along the Swannanoa River. The high water halted traffic for about 1 hour and caused some road damage. Three young persons were swept through a small culvert, one of which suffered injuries. The high water completely covered the Municipal Golf Course along the Swannanoa River Road.

White Basin--The Cache River at Patterson, Ark., rose above flood stage on June 1 and continued at or slightly above flood stage for about 48 hours. The crest on the 2d was 0.1 foot above flood stage. The rise was due to heavy rain that occurred over the basin on May 24. No damage resulted from the slight flooding.

Arkansas Basin--Flooding in the Arkansas Basin during June was confined principally to the Cottonwood and the upper Neosho Rivers in Kansas. The high water was due to frequent thundershowers. Storms during the first 3 days of the month totalled 6 to 7 inches. Subsequent rains kept the stream flow at a relatively high level through the middle of the month. The total damages were estimated at nearly $1 million.

Heavy thundershowers during the night of June 2 produced brief flooding in low areas and underpasses in southern and southeastern Tulsa, Okla.

WEST GULF OF MEXICO DRAINAGE

Severe to extreme drouth conditions persisted over the upper Trinity and upper Brazos Basins in Texas during June. Rainfall amounts averaged less than 2 inches.

Locally heavy rains on the upper West Nueces Basin in Texas on the 13th caused flash flooding along the West Nueces River late on the 13th and on the 14th, closing farm roads in Edwards and Kinney Counties. Additional rains of 2 to 3 inches on the morning of the 15th caused more flash flooding with the closing of farm roads through the 15th.

Local flash flooding occurred on the Atascosa River, San Miguel Creek, and the lower Frio River in Texas due to rain amounts ranging up to 5 inches during the evening of the 15th.

Heavy rains on the 26th and 27th caused flooding on Turkey Creek at Crystal City, Tex. The flooding continued from June 29 to July 5 with a crest 9.6 feet above flood stage on July 1. The flood waters from Turkey Creek reached the Nueces River on the morning of the 29th. This, plus local runoff, caused extensive flooding along the Nueces from below Crystal City to below Cotulla, Tex. Water from San Roque Creek above Cotulla entered the Nueces on the night of the 30th causing major flooding at Cotulla on July 1, with a crest of 25.74 feet, which was 10.7 feet above flood stage. This was the third highest crest of record.

GREAT BASIN

The only river basin in Utah experiencing serious high water during the snowmelt season was the Bear River. This basin had one of the largest mountain snowpacks during the past winter and early spring that had occurred in recent years.

The U. S. Geological Survey Office at Logan, Utah, reported the highest crest at Logan since 1916. The lower Bear River near Corinine, Utah, reported a

streamflow of 7,360 c.f.s., which compares with the most recent high water period of 1952 when 7,200 c.f.s. was recorded. General flooding of agricultural lands occurred in many areas of the Bear River Basin in southeastern Idaho and extreme southwestern Wyoming. Very little damage occurred to residences and businesses.

PACIFIC SLOPE DRAINAGE

Columbia Basin--Extremely cool weather was observed throughout the Columbia Basin during June. Temperatures were above normal on only four days, 12th, 20th, 21st, and 22d. However, measurable precipitation was observed somewhere in the Columbia Basin on every day of the month. There were two main rainy periods. The first occurred during the first week of June, while the heavier rain occurred during the last week of June.

Streams throughout the Snake River Drainage flowed greater than normal throughout the month. The below normal temperatures were instrumental in preventing major flood problems. Nearly all streams in the Snake Basin were at bankfull stage or overflowing.

Locally heavy rain caused flash flooding along Pocatello Creek and on South First Avenue in Pocatello, Idaho, on the 9th-10th. County roads were badly washed, but remained passable. Some 1,200 telephones became inoperative. Some water spilled into a few basements.

Major flooding occurred in the Payette drainage of central Idaho on the 27th-28th due to snowmelt augmented by rainfall runoff. Several stations reported precipitation amounts in excess of 1 inch during the last week of June. The railroad bed, as well as some 200 acres of farmland in the vicinity of Montour, Idaho, was flooded. Minor damage was reported at Horseshoe Bend and along the Payette River below Emmett, Idaho. Mud slides occurred on Highway 55 near Banks, Idaho, at the confluence of the North and South forks of the Payette River.

In eastern Idaho, the Henrys Fork, Teton, and South Fork of the Snake River were at bankfull stage or above during the last week of the month. Many acres of farm and pasture lands were inundated along the Teton River, below the proposed site of the lower Teton Dam. Spring plantings of potatoes, sugar beets, and grain between Sugar City and Teton City rotted under the flooded fields. Most pasture lands remained under water too long, killing pasture grasses. Crop losses in this area are expected to total tens of thousands of dollars.

The Hoback, Salt, and Grays Rivers in West Wyoming above the Palisades Reservoir, were extremely high with some 8,000 acres of farmland under water. Many county roads were washed out. The Palisades Reservoir was instrumental in preventing excessive flooding lower on the Snake River.

In eastern Oregon, rainfall amounts of 0.5 to 1 inch on the 26th-29th produced overbank flows on several Wallowa mountain streams. Hurricane Creek ran bankfull in the upper valley reaches but overflowed in the vicinity of Enterprise, Oreg., flooding a fish hatchery road. Minor flooding was reported where Hurricane Creek enters the Wallowa River. The Lostine River overflowed its banks and flooded the valley about 3 miles upstream from Lostine, Oreg.

Streamflow in the lower Columbia River was controlled by reservoir storage and changed very little during the first 3 weeks of June before receding below flood stage on June 30. The stage of the Columbia River at Vancouver, Wash., was 18.8 feet on June 1 and remained near 18 feet until the 21st.

Records of the U. S. Geological Survey indicate natural mean flow of the Columbia River at Vancouver, Wash., during June was 630,800 c.f.s., or 113 percent of the 15-year average. Mean flow of the Willamette River at the mouth for June, under natural conditions, was reported as 26,120 c.f.s., or 129 percent of average.

ALASKA

Serious flooding occurred in Alaska on the lower Yukon, Kuskokwim, and Kobuk Rivers due to ice jams and greater than normal snowpack. Backwater from ice jams resulted in a stage of 0.6 foot above the previous maximum stage of 1963 on the Yukon River near Ruby, Alaska. Property in villages was damaged by large floating ice cakes as well as by water and silt.

[illegible] the average monthly station pressures for the month of record, corrected to the height of the [illegible]

[illegible] speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

[illegible] bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun.

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Note.--Langley is the unit used to denote one gram calorie per square centimeter.

Values with an asterisk are interpolated.
t Indicates urban sites

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska

JUNE 1971

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	96	176	206	210	243	238	118	63	153	103	89	63	118	69	146	174	160	199	180	193	80	274	274	286	265	265	144	59	13	141		159

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they are measured has not been checked by the NOAA National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (3900 Å) at Ames, Iowa

Date. . . .	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. .	21.66	19.18	21.78	20.24	21.47	16.69	16.93	18.17	20.48	20.48	15.62	17.28	17.04	11.60	11.95	18.94	19.65	21.43	20.36	22.37	21.07	20.95	21.66	20.83	17.86	18.58	21.78	19.65	20.48	17.87		19.07

These data are from an U - V Epply total ultra violet sensor and Speedomax H (Leeds Nertrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code [illegible] defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo cms.

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), June.

B. Temperature Departure from 30 - Year Mean (°F 1931-60), June 1971.

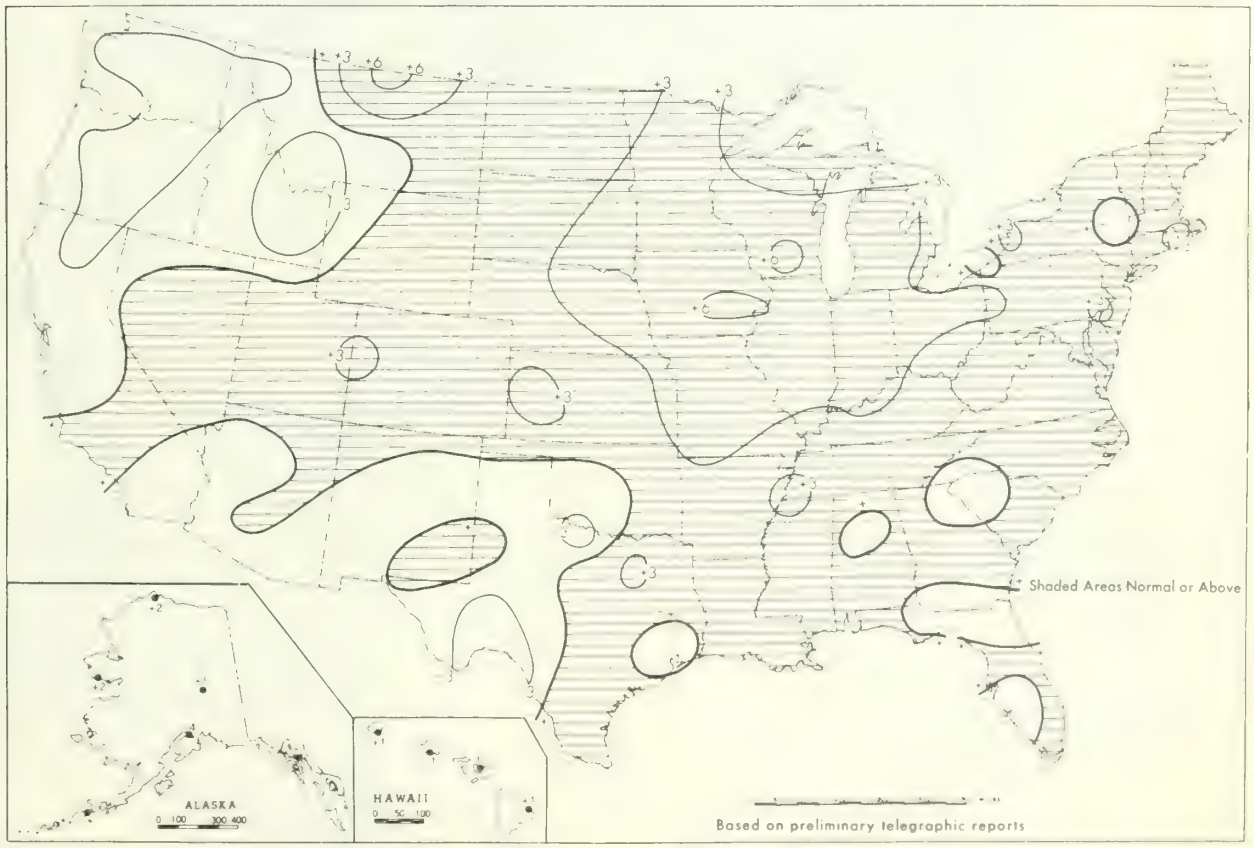

Chart II Total Precipitation (Inches), June 1971.

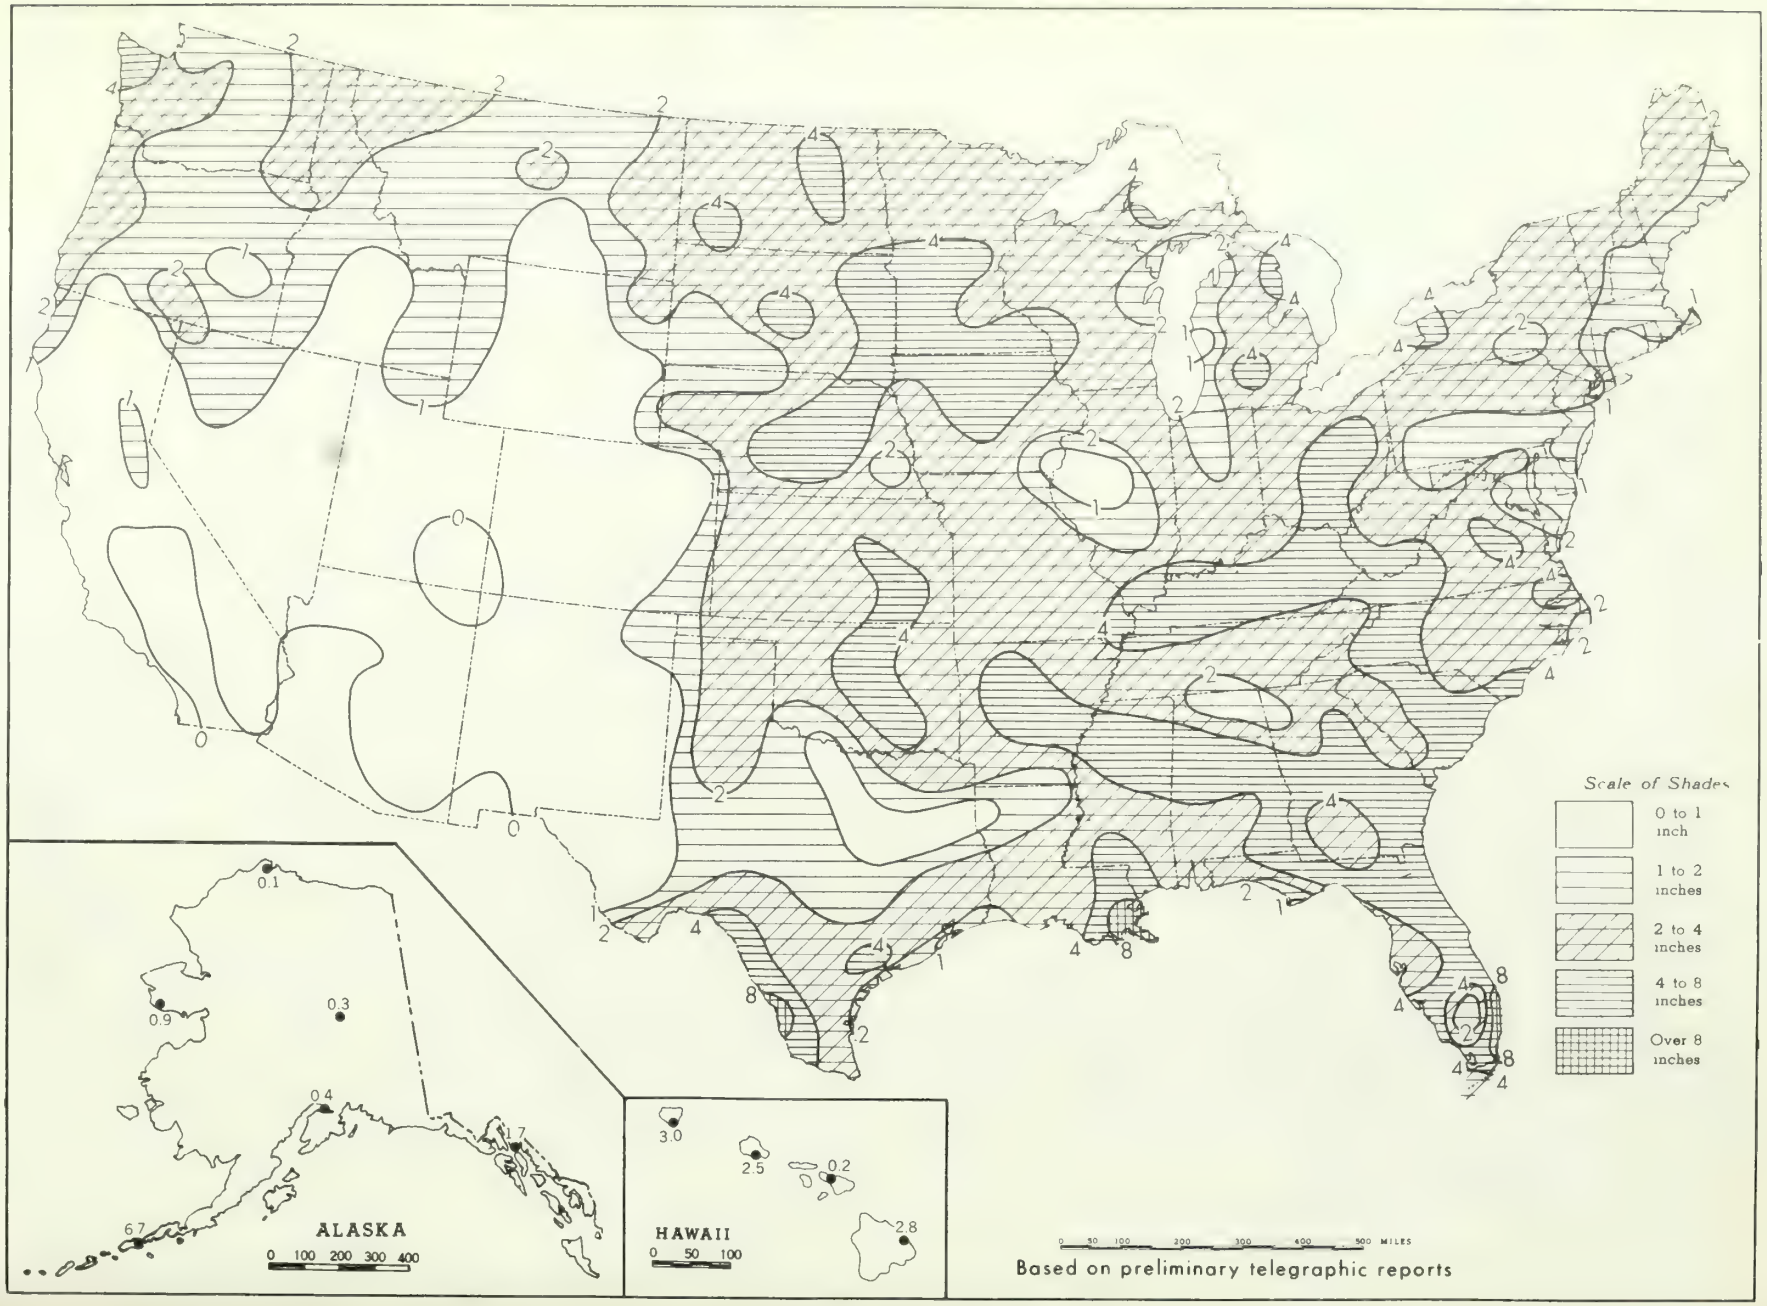

Chart III. Percentage of Normal Precipitation, **June 1971.**

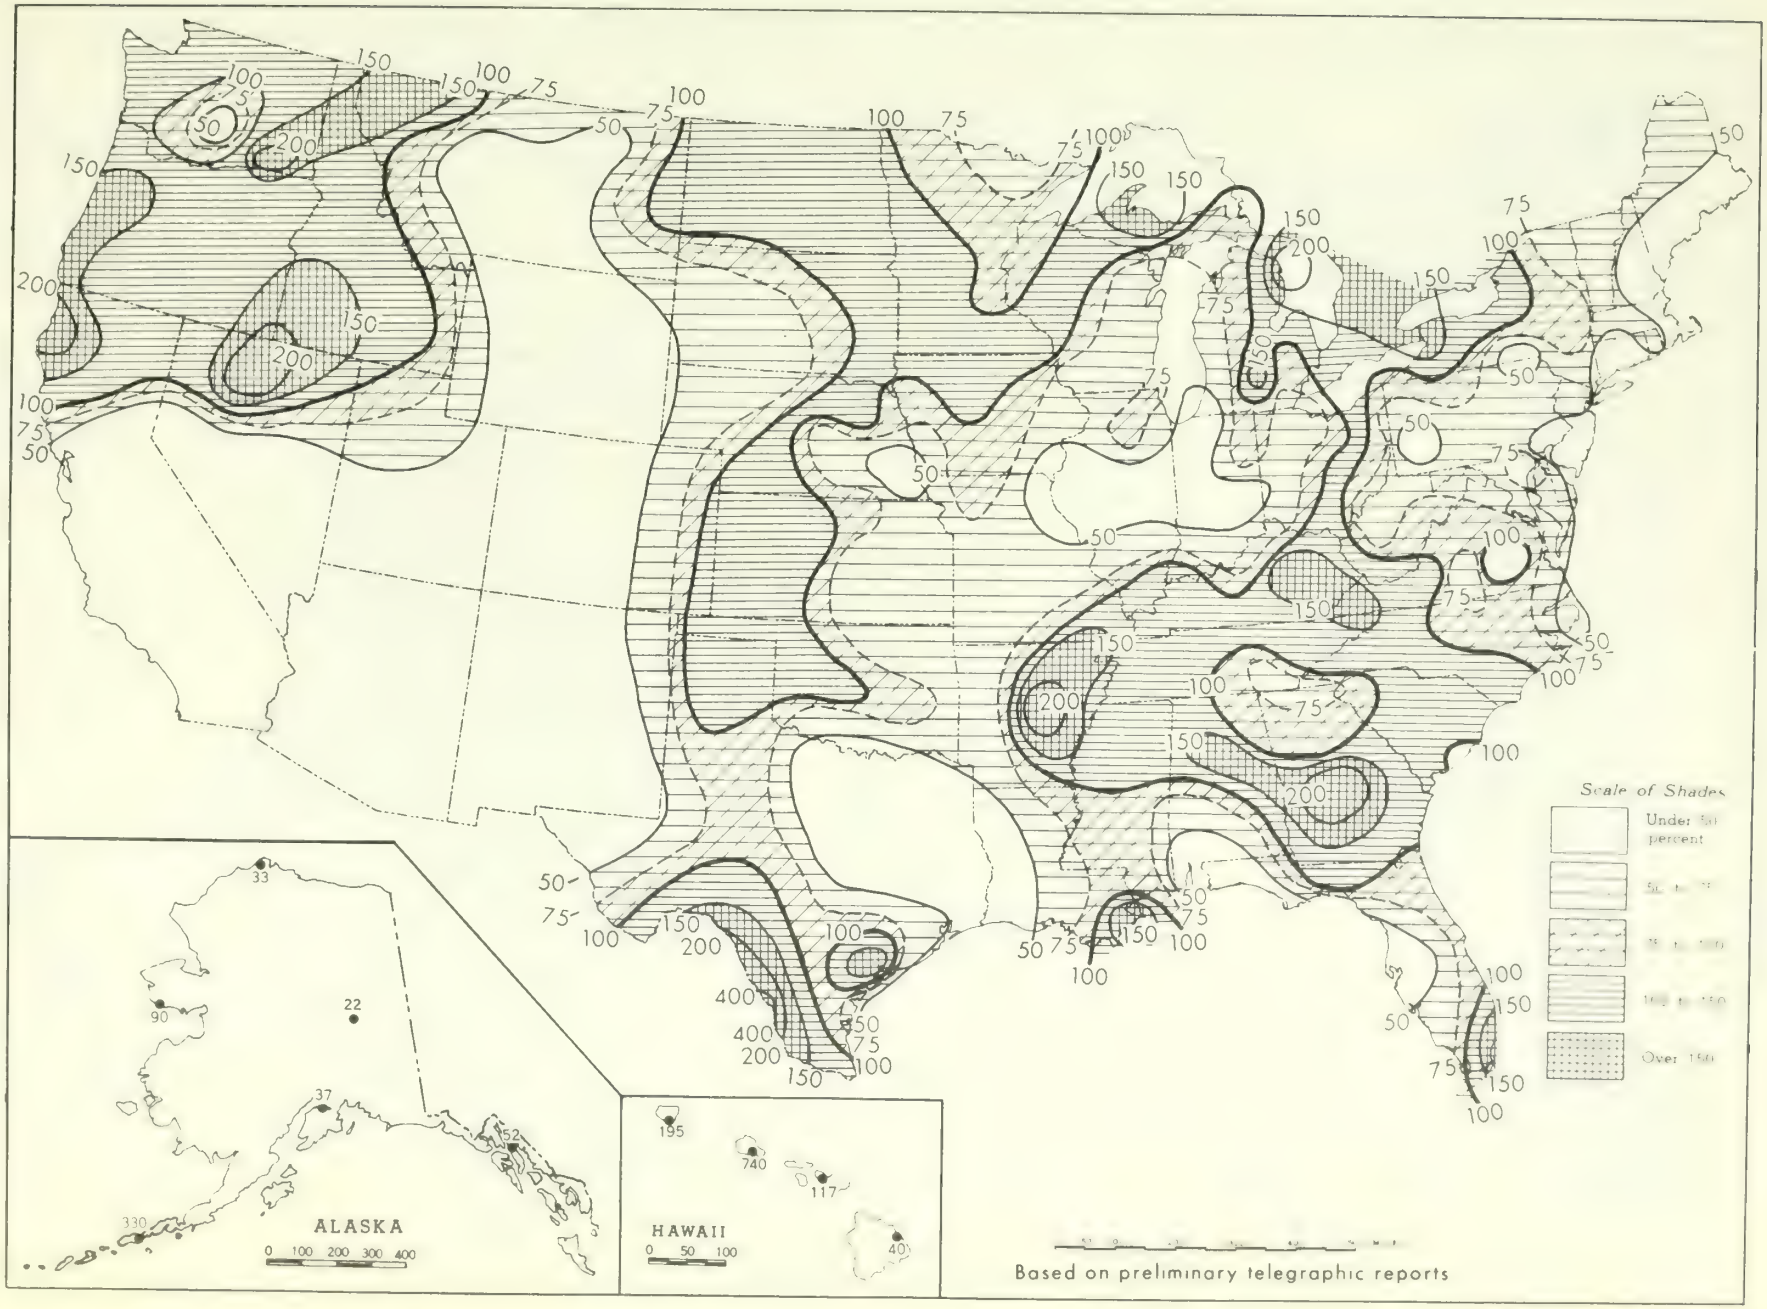

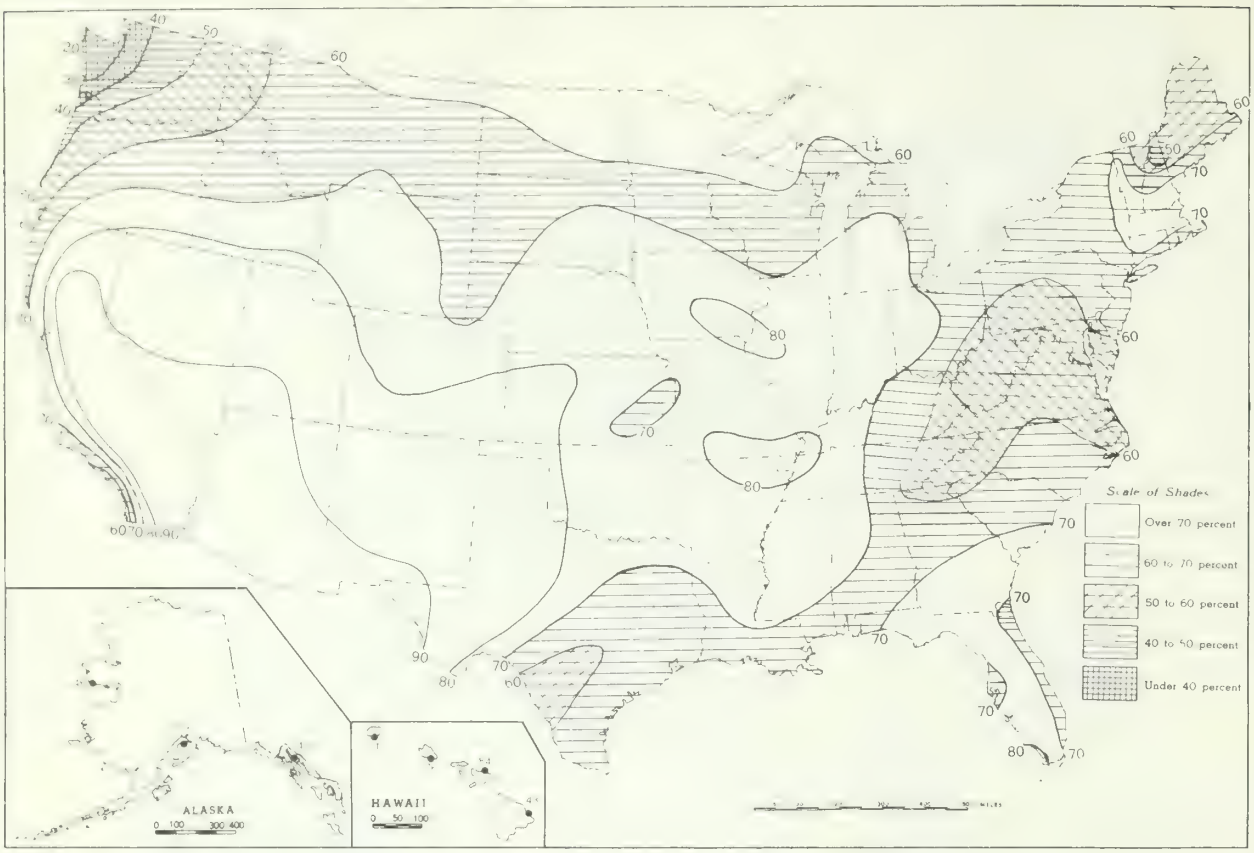

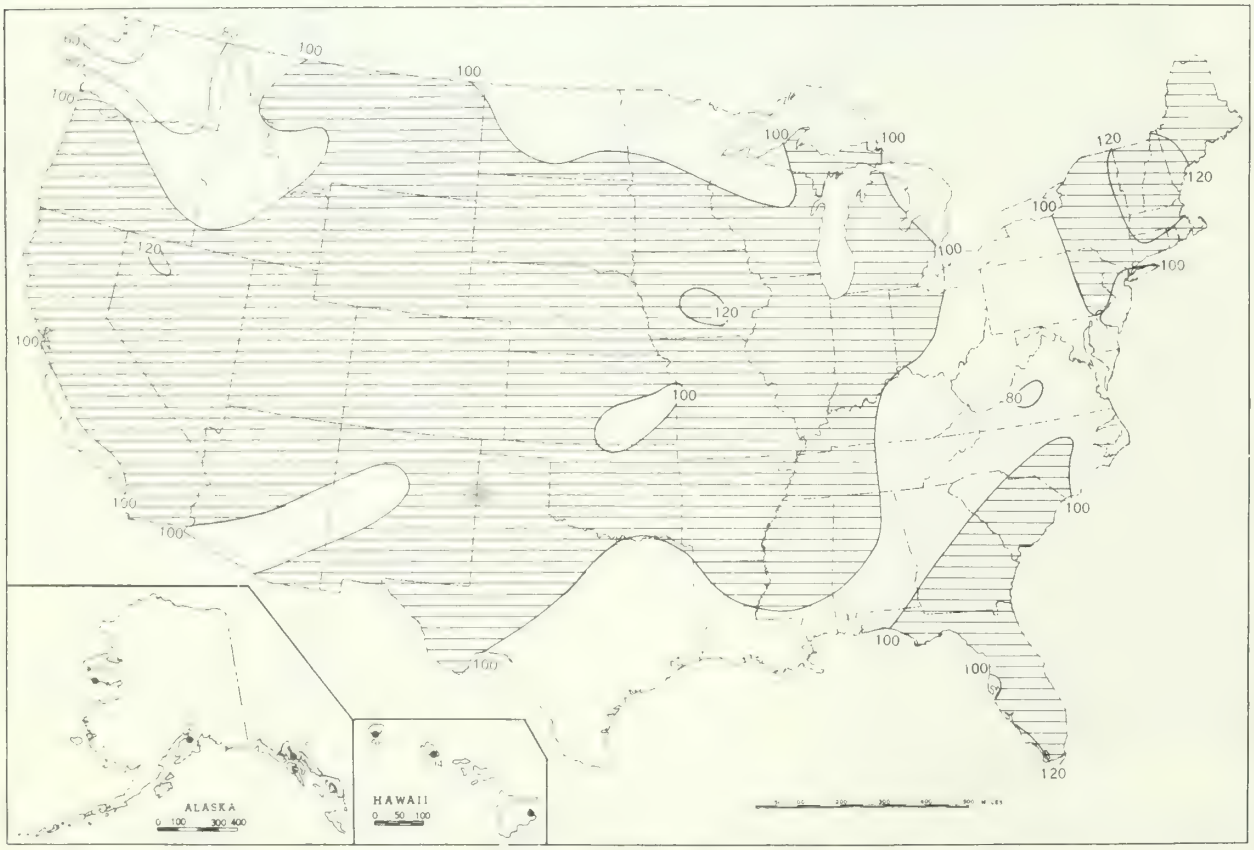

Chart VI. A. Percentage of Possible Sunshine, **June 1971.**

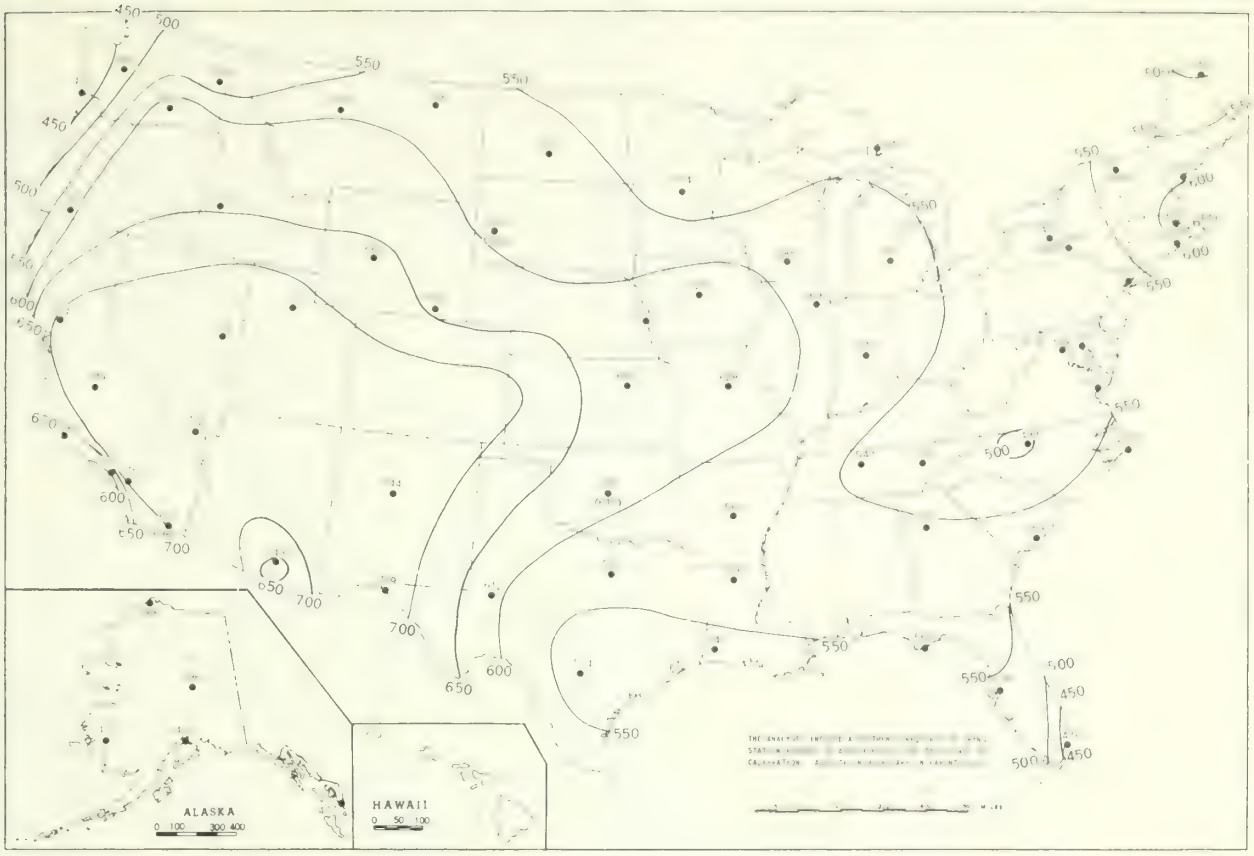
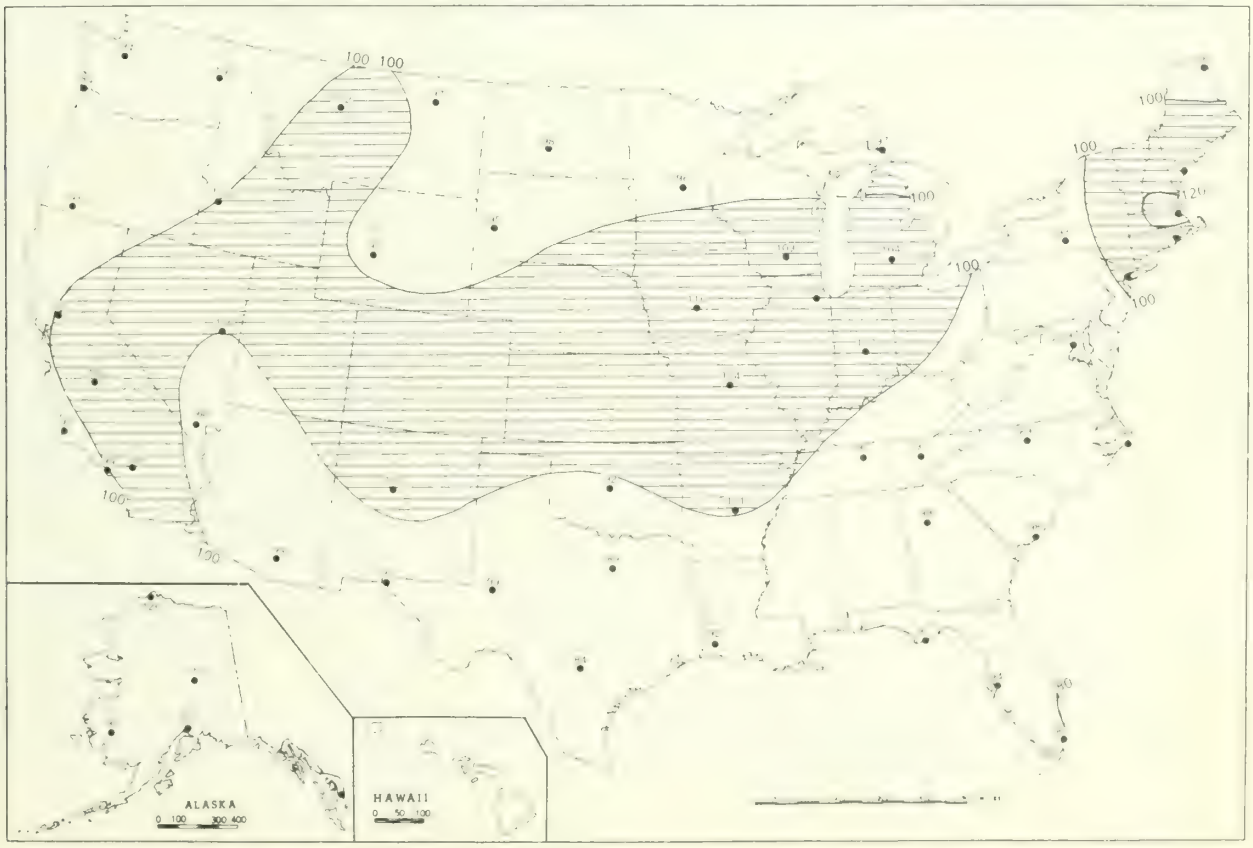
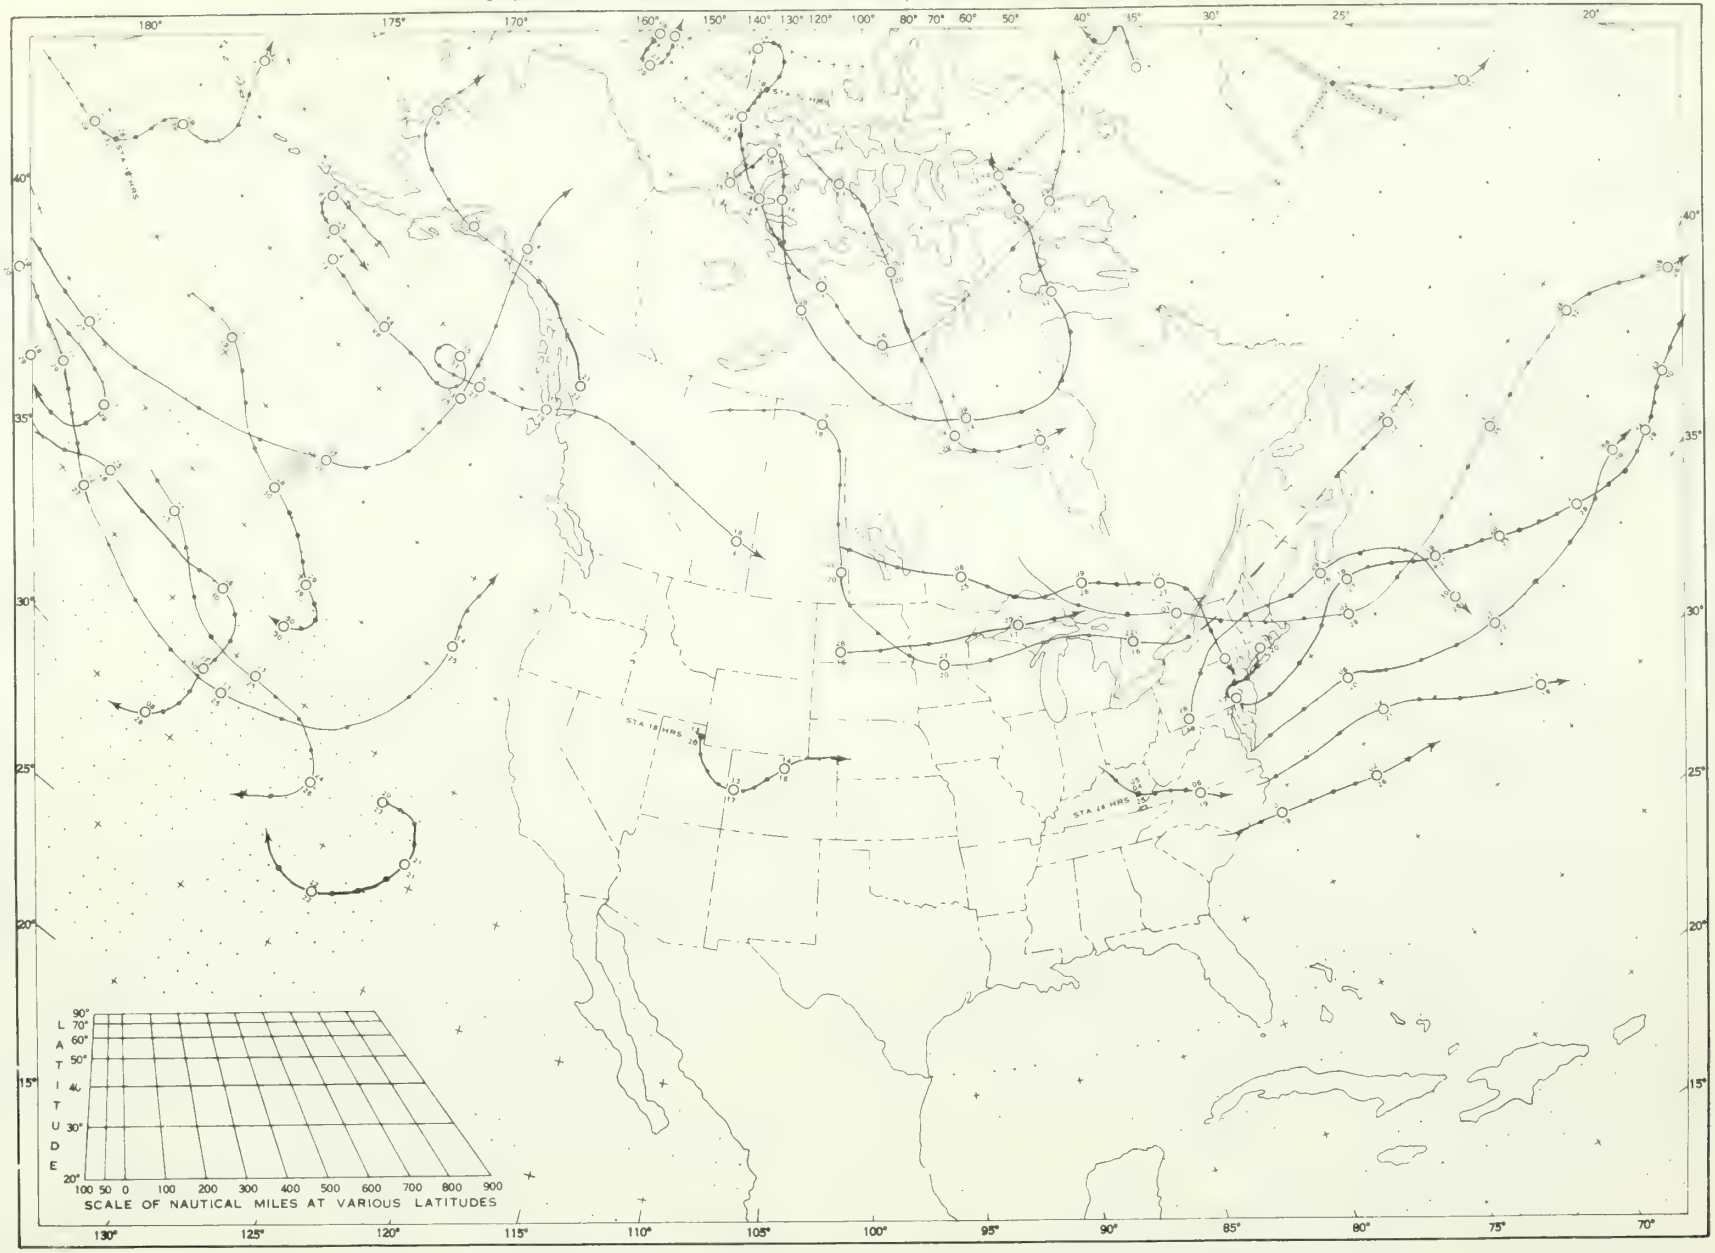


B. Percentage of Mean Monthly Sunshine, **June 1971.**



A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

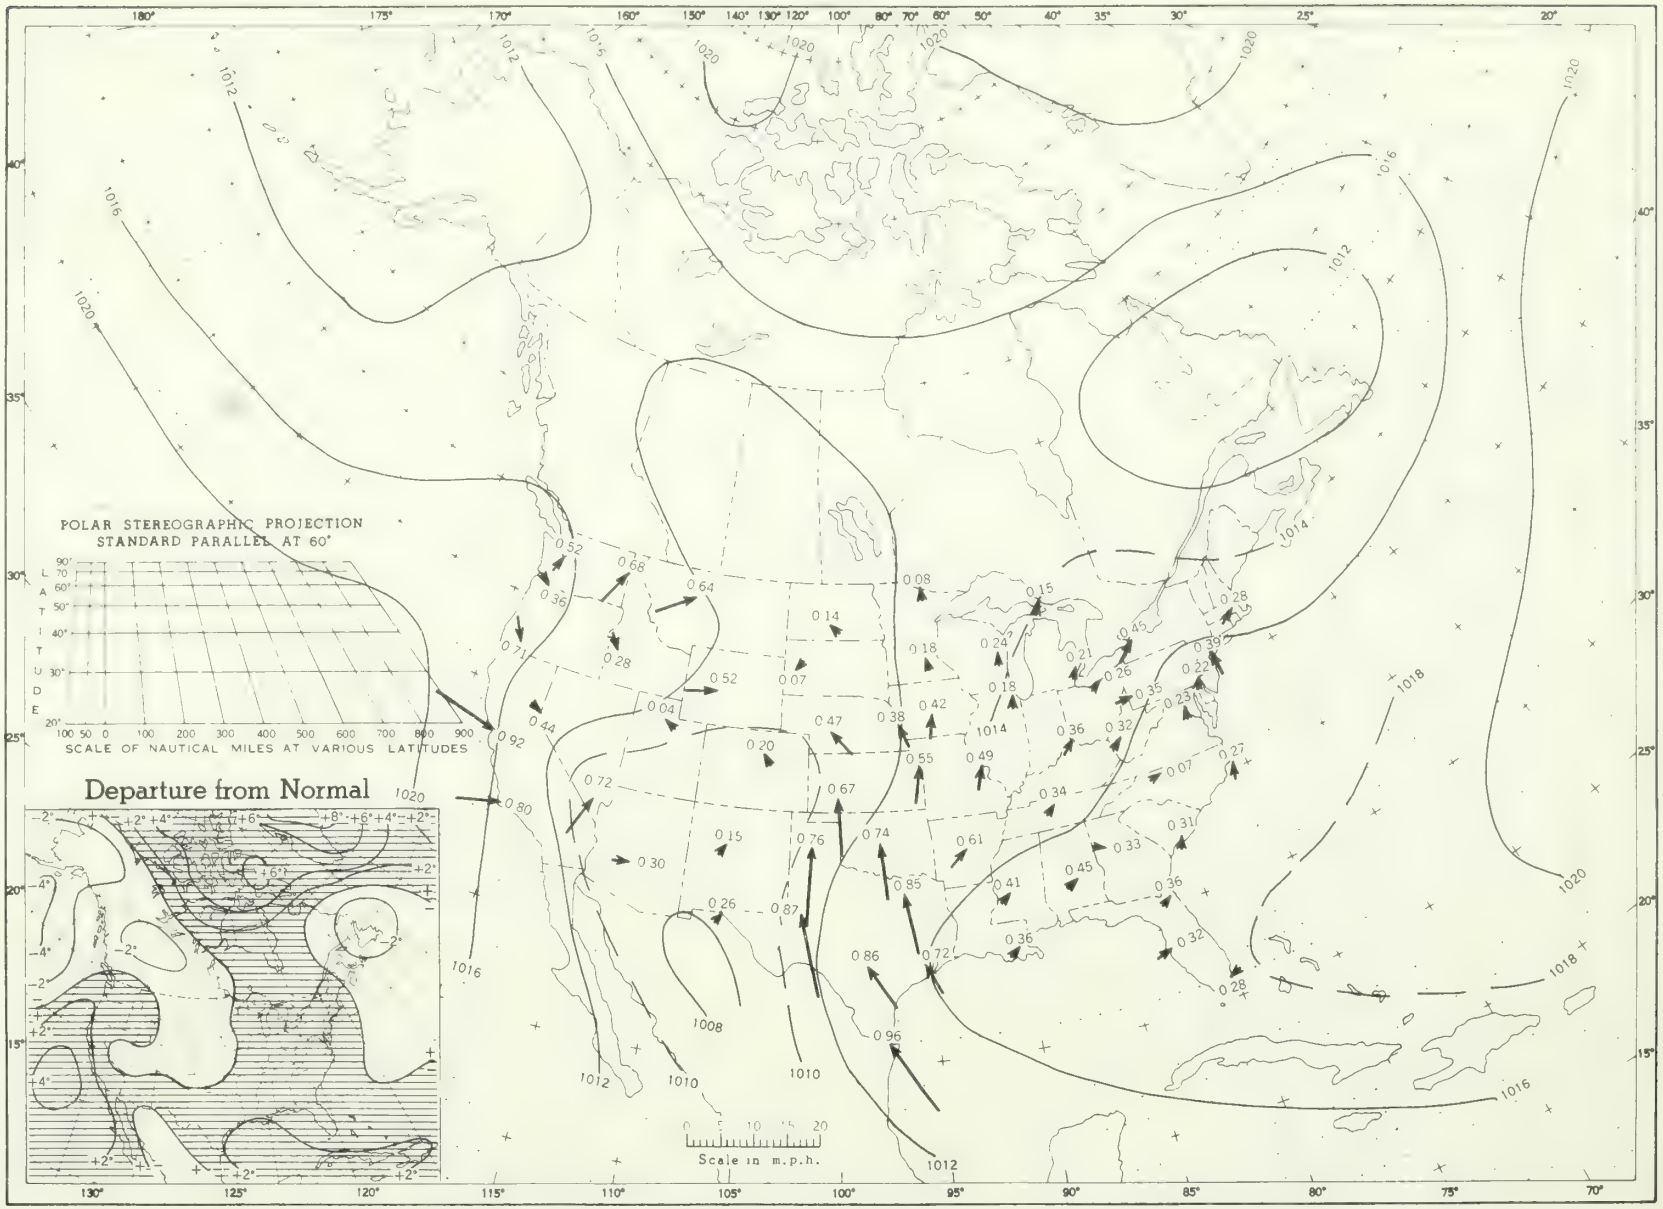
Chart VII. A. Average Daily Values of Solar Radiation, Langleys, June 1971.



B. Percentage of Mean Daily Solar Radiation, June 1971.

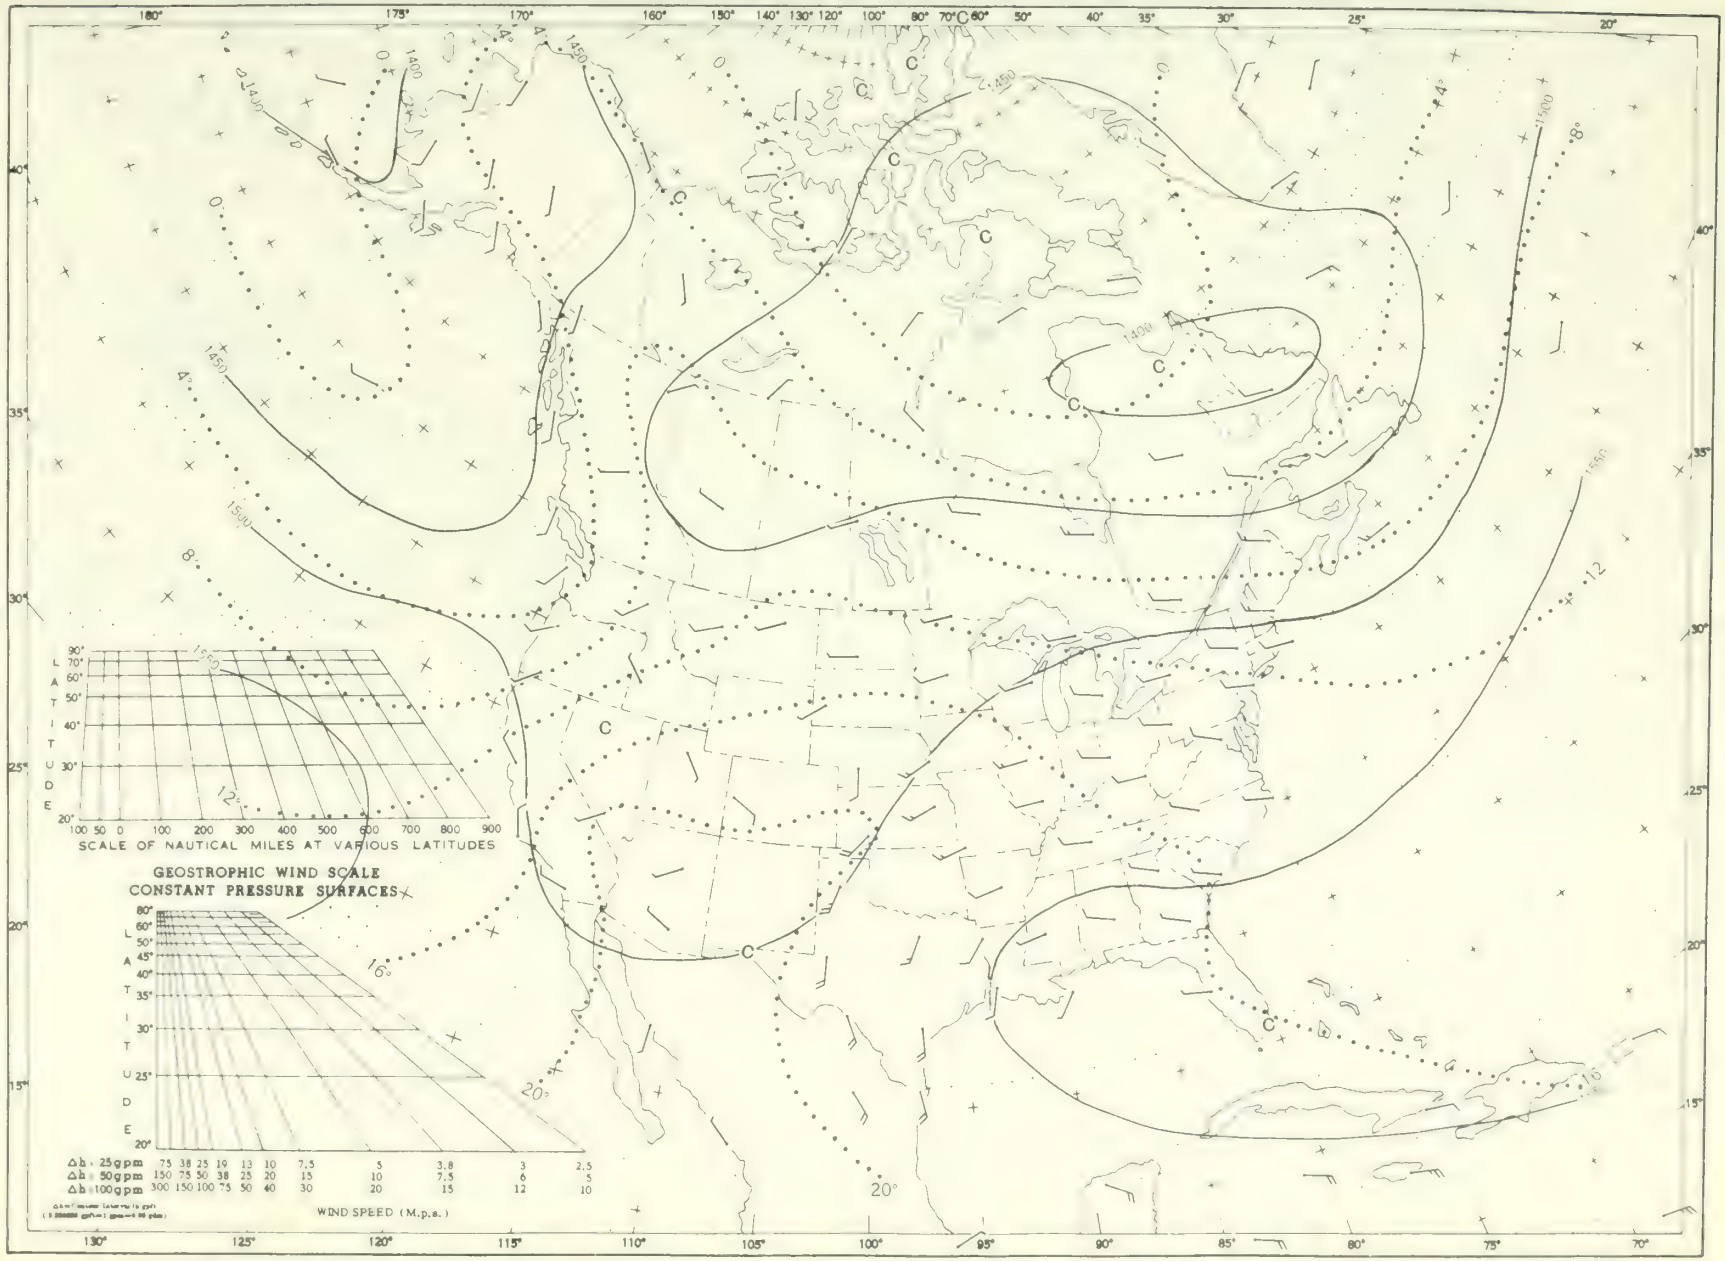
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII Tracks of Centers of Anticyclones at Sea Level June 1971.



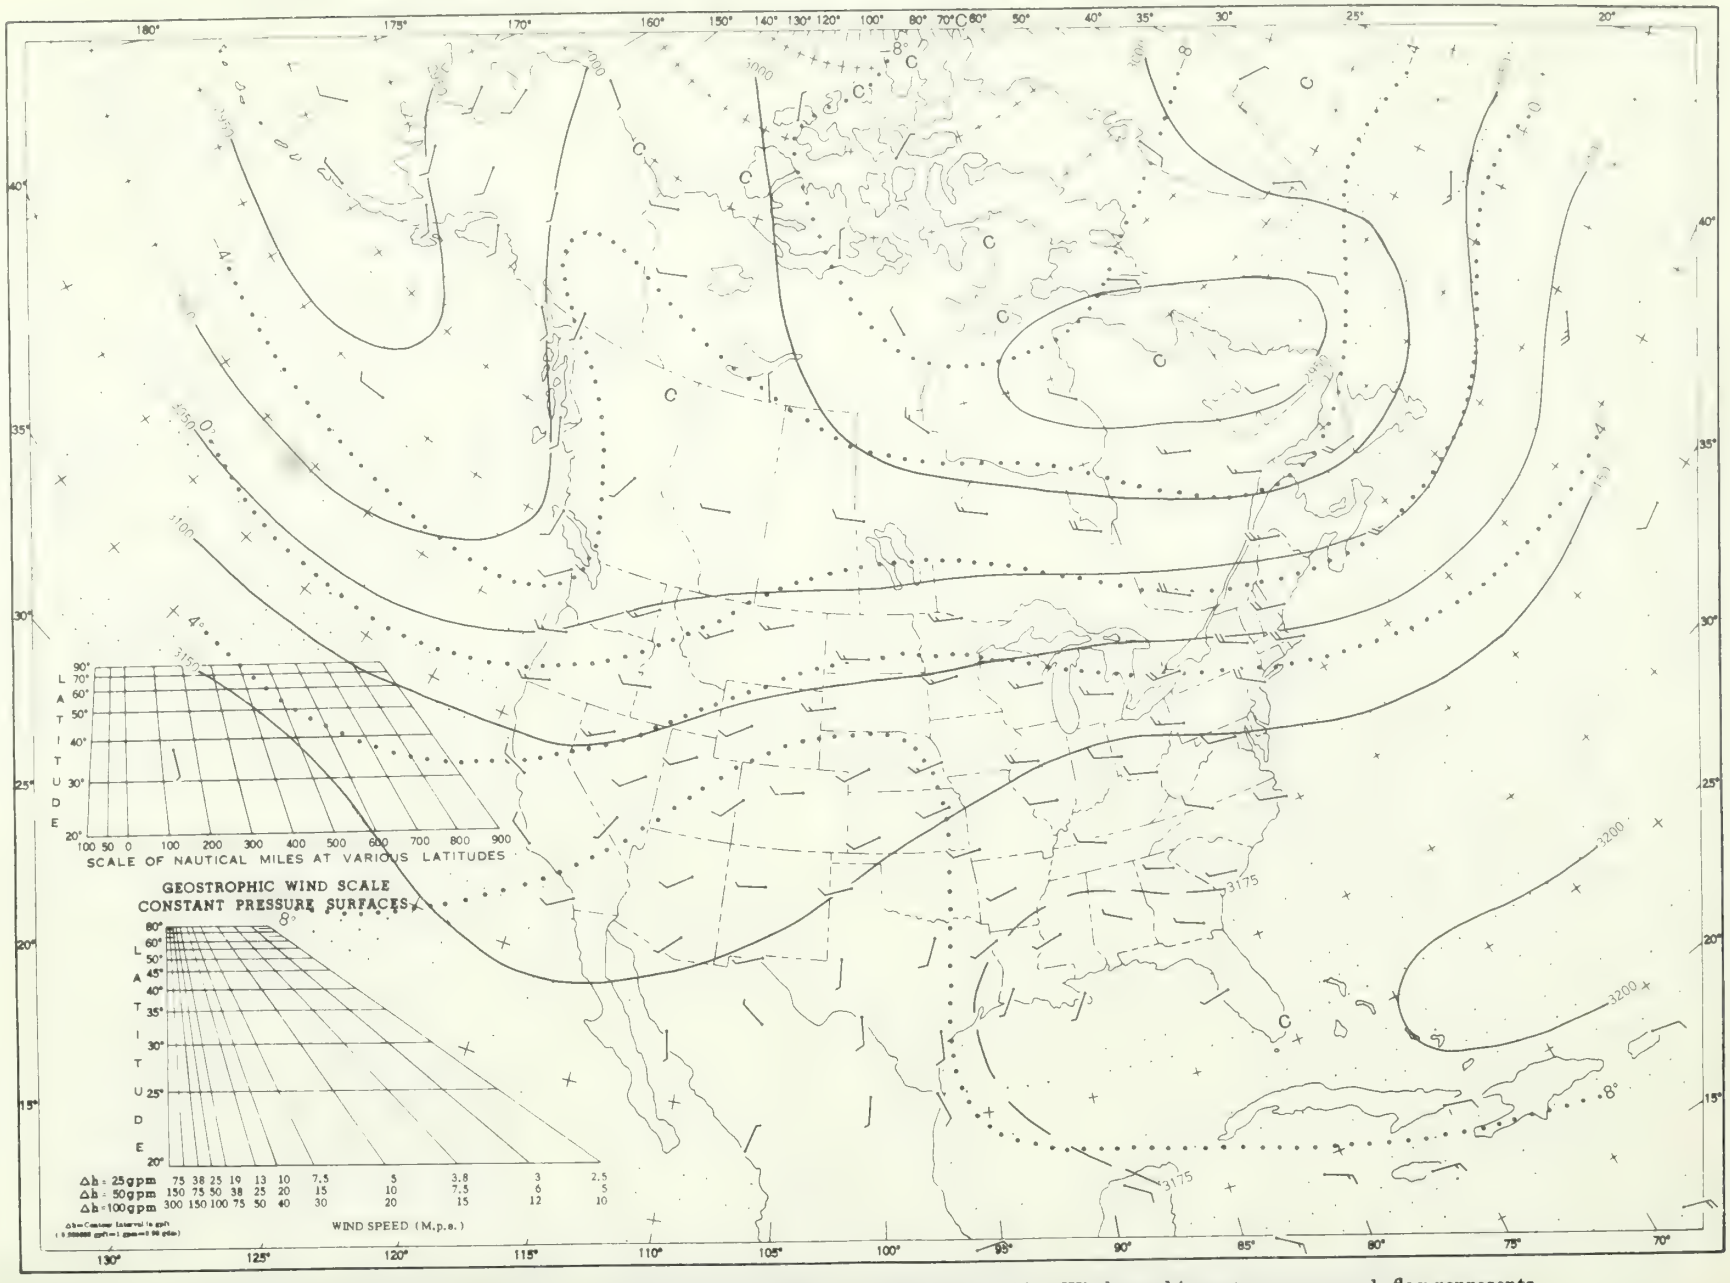
Circle indicates position of center at 7:00 a.m. e.s.t. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX Tracks of Centers of Cyclones at Sea Level, June 1971.



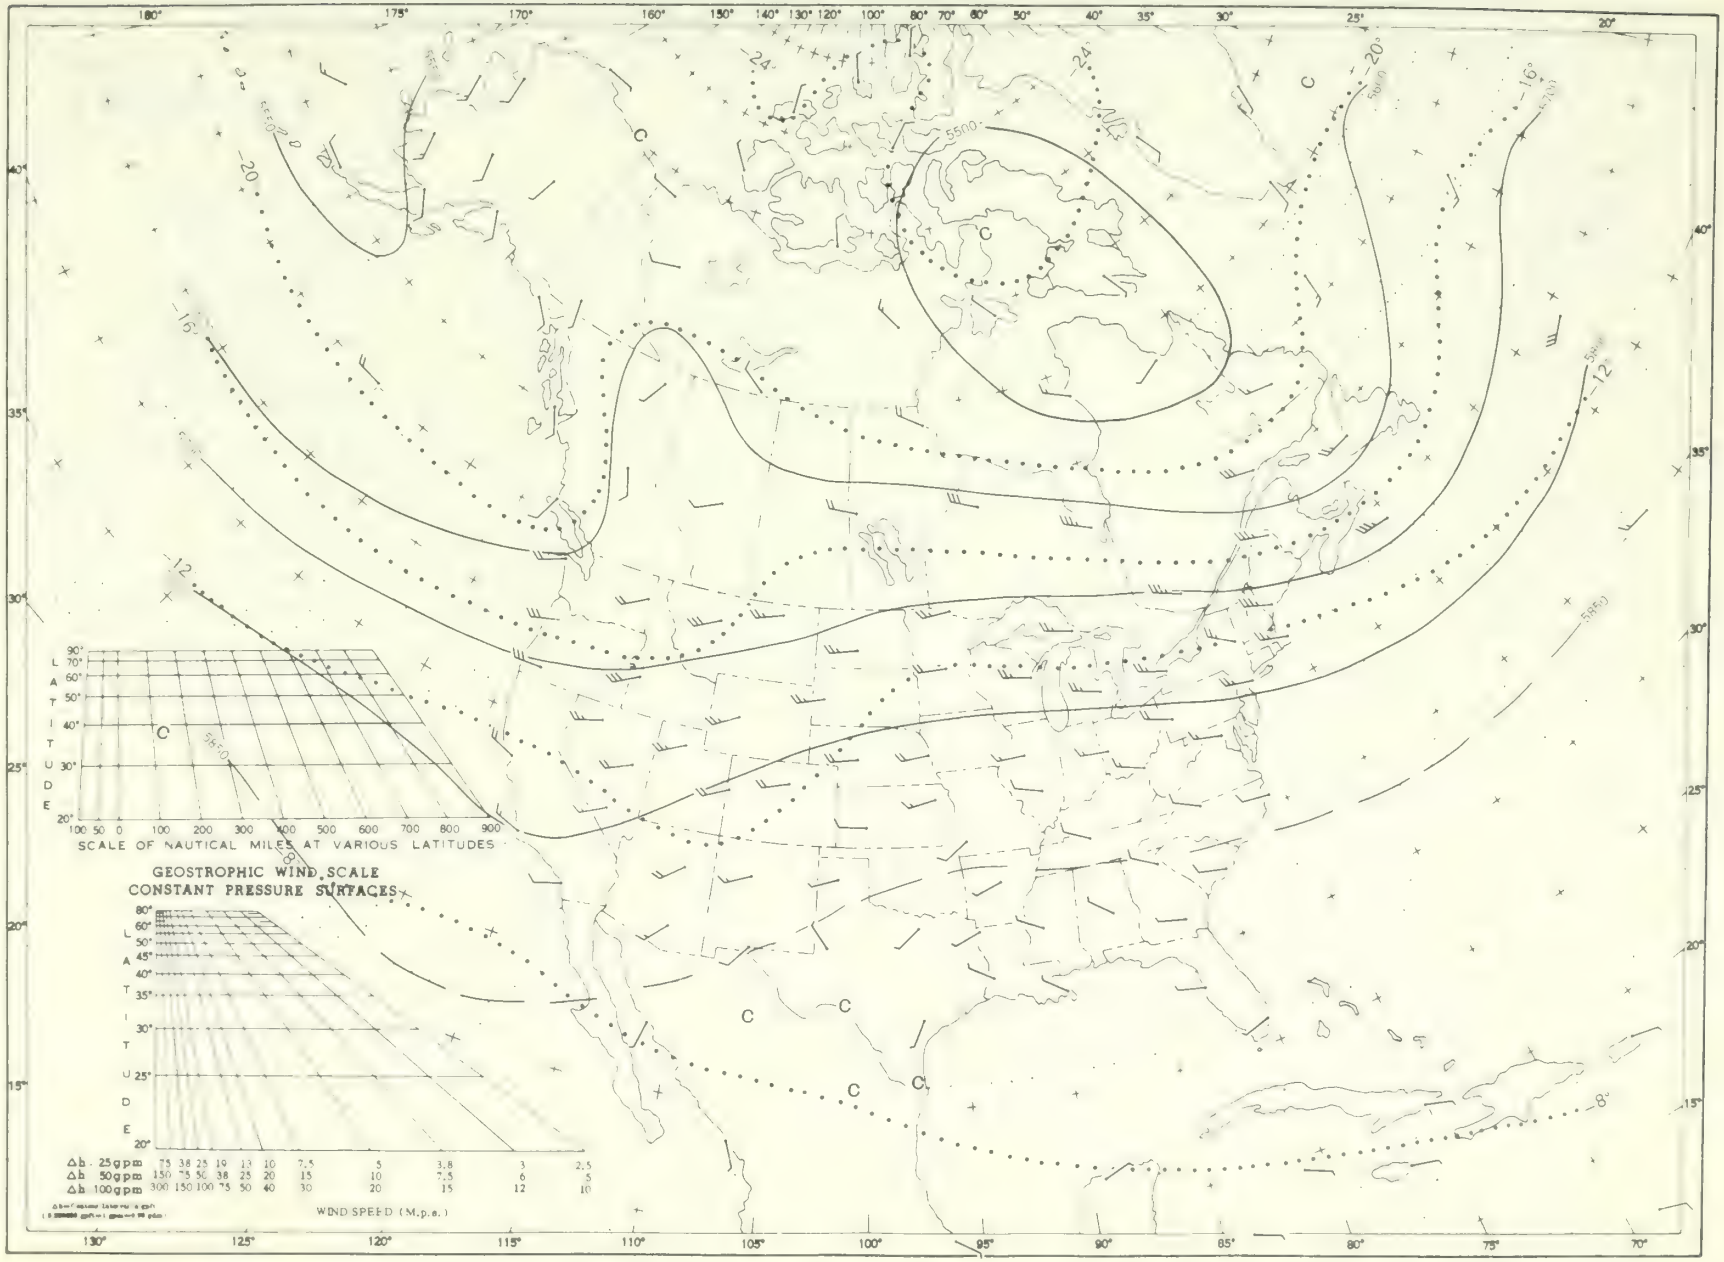
Circle indicates position of center at 7:00 a.m. e.s.t. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6 hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X Average Sea Level Pressure (mb) and Resultant Surface Wind, **June 1971**. Inset Departure of Average Pressure (mb) from Normal, **June 1971**.



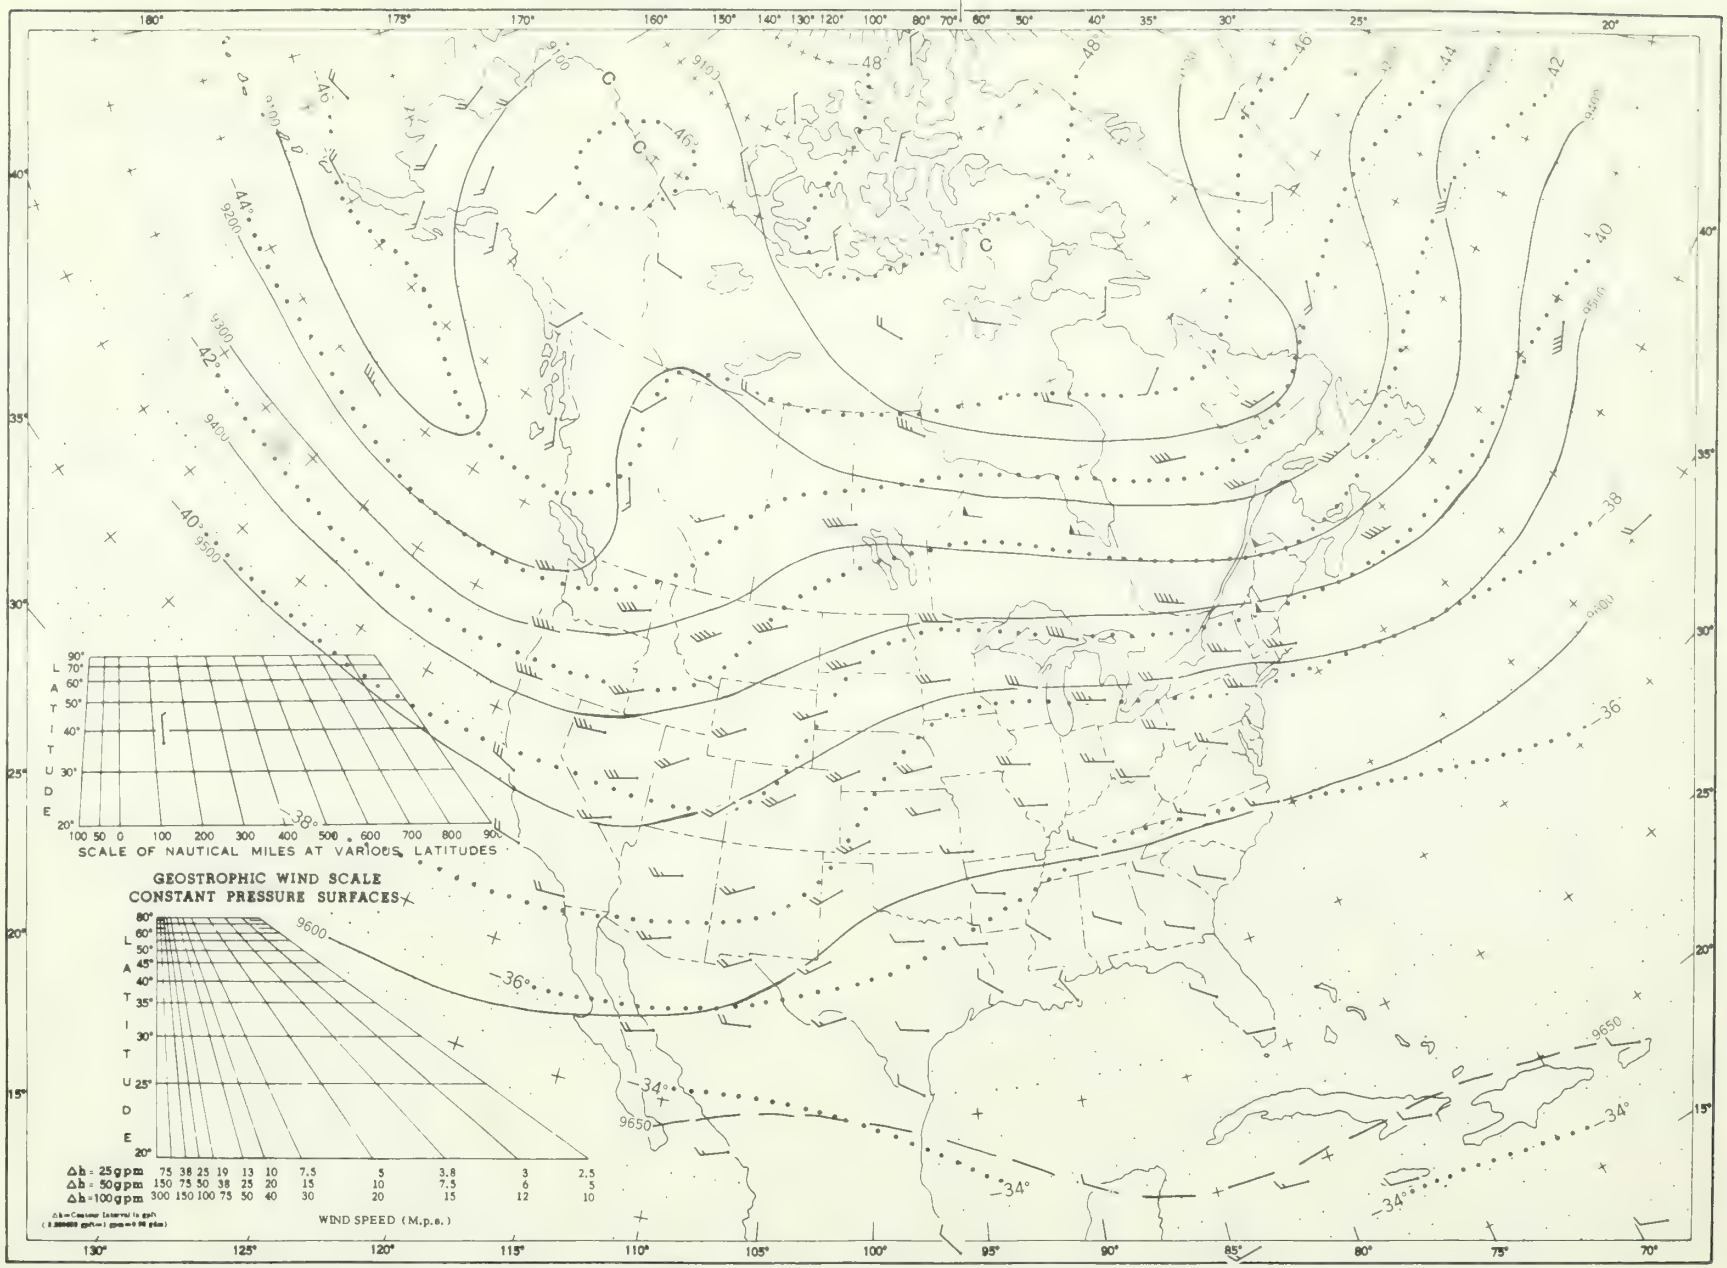
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI 350-mb Surface, 1200 G.m.t., **June 1971**. Average Height and Temperature, and Resultant Winds



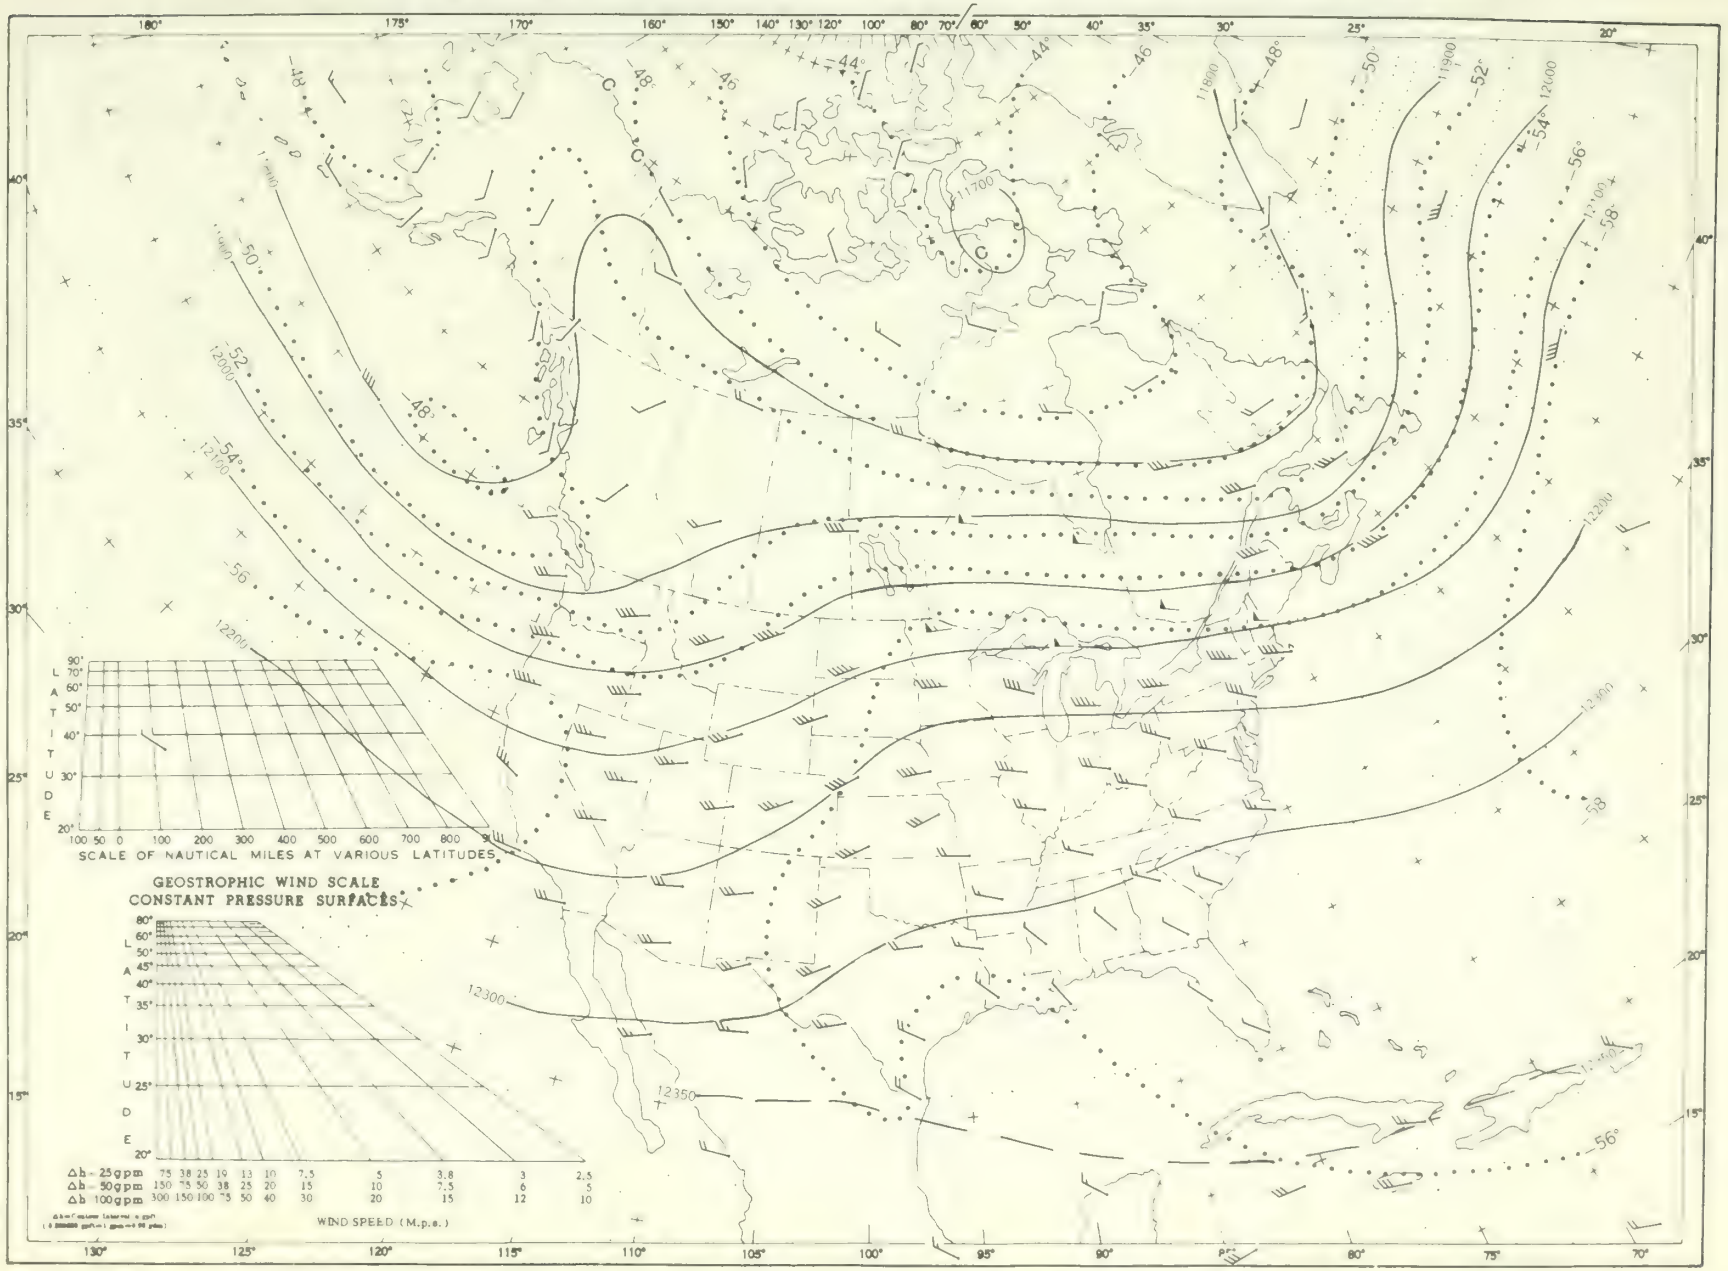
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII 700-mb Surface, 1200 G.m.t., June 1971. Average Height and Temperature, and Resultant Winds



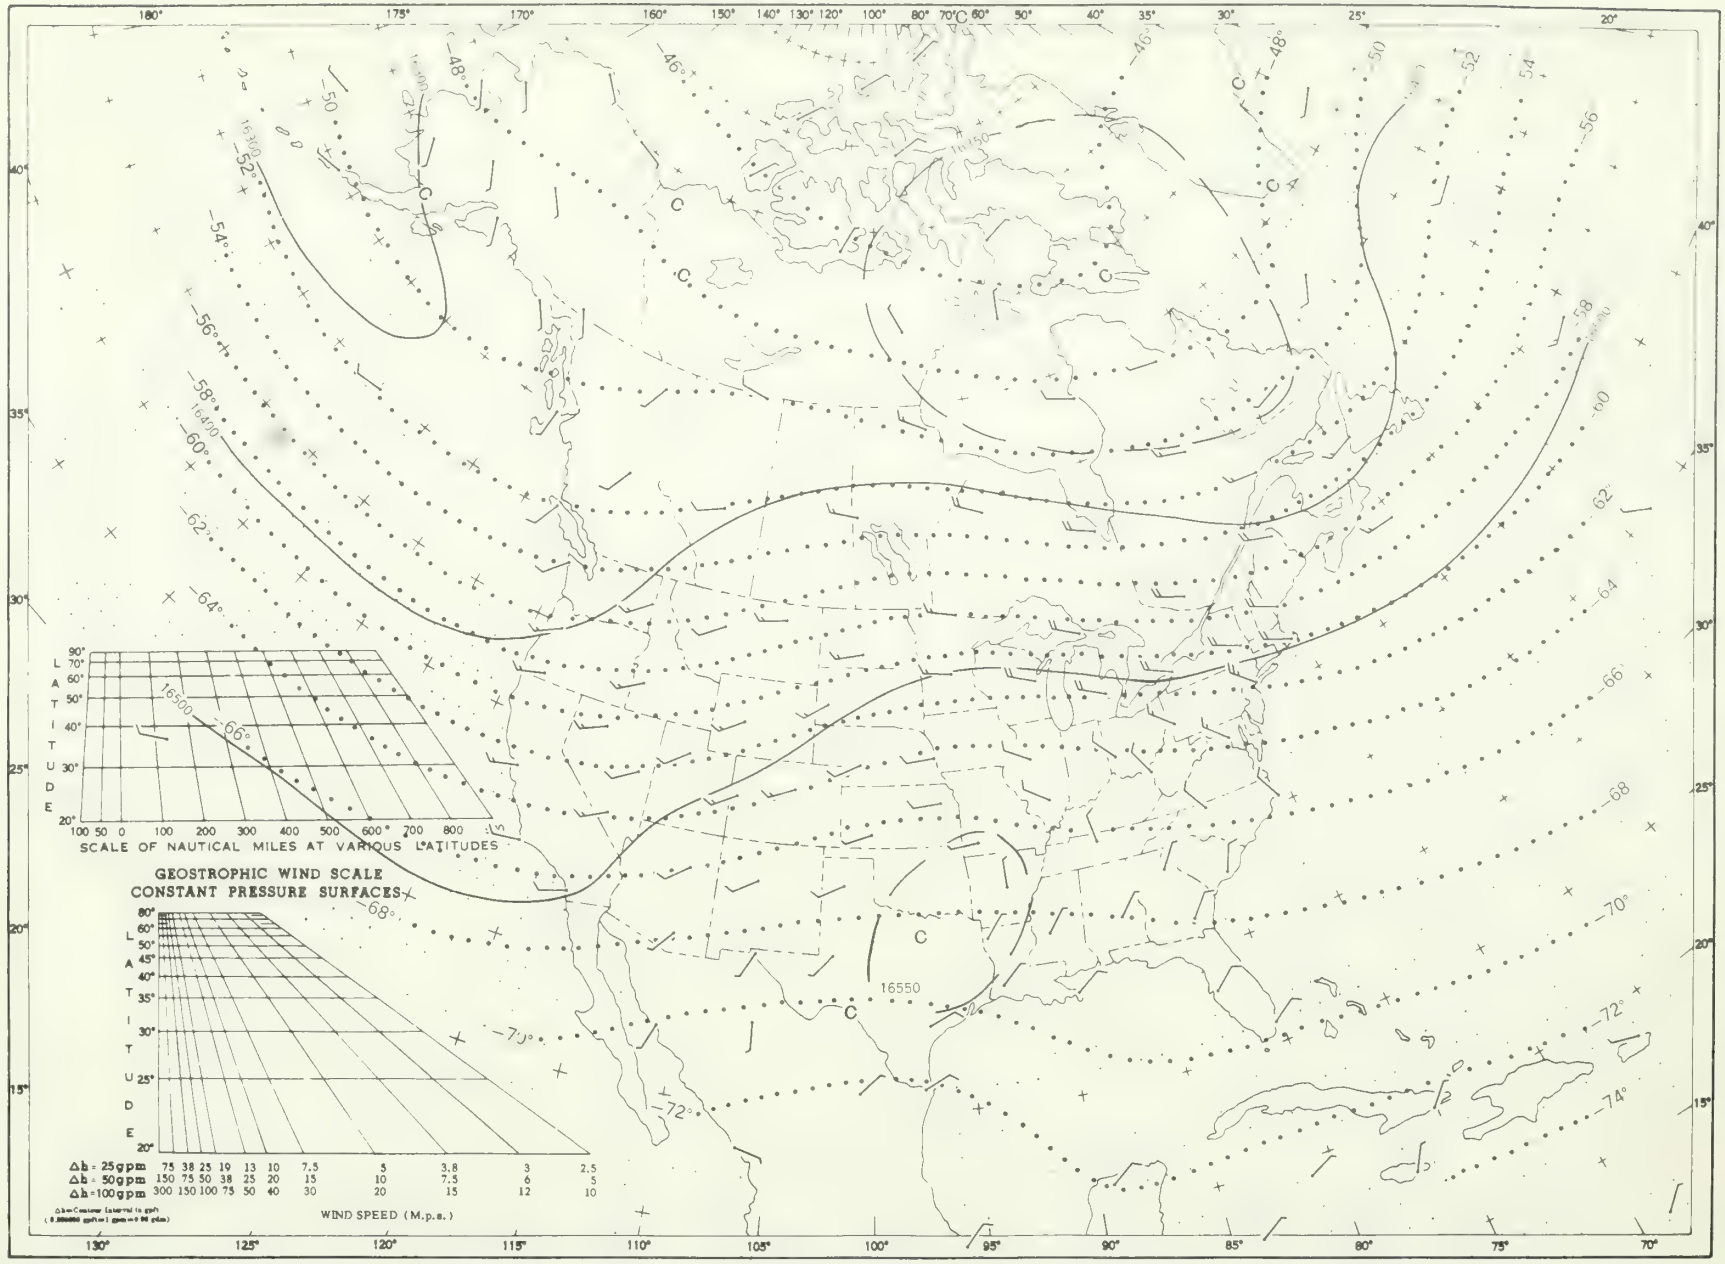
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII 500-mb Surface, 1200 G.m.t., **June 1971**. Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV 300-mb Surface, 1200 G.m.t., **June 1971**. Average Height and Temperature, and Resultant Winds

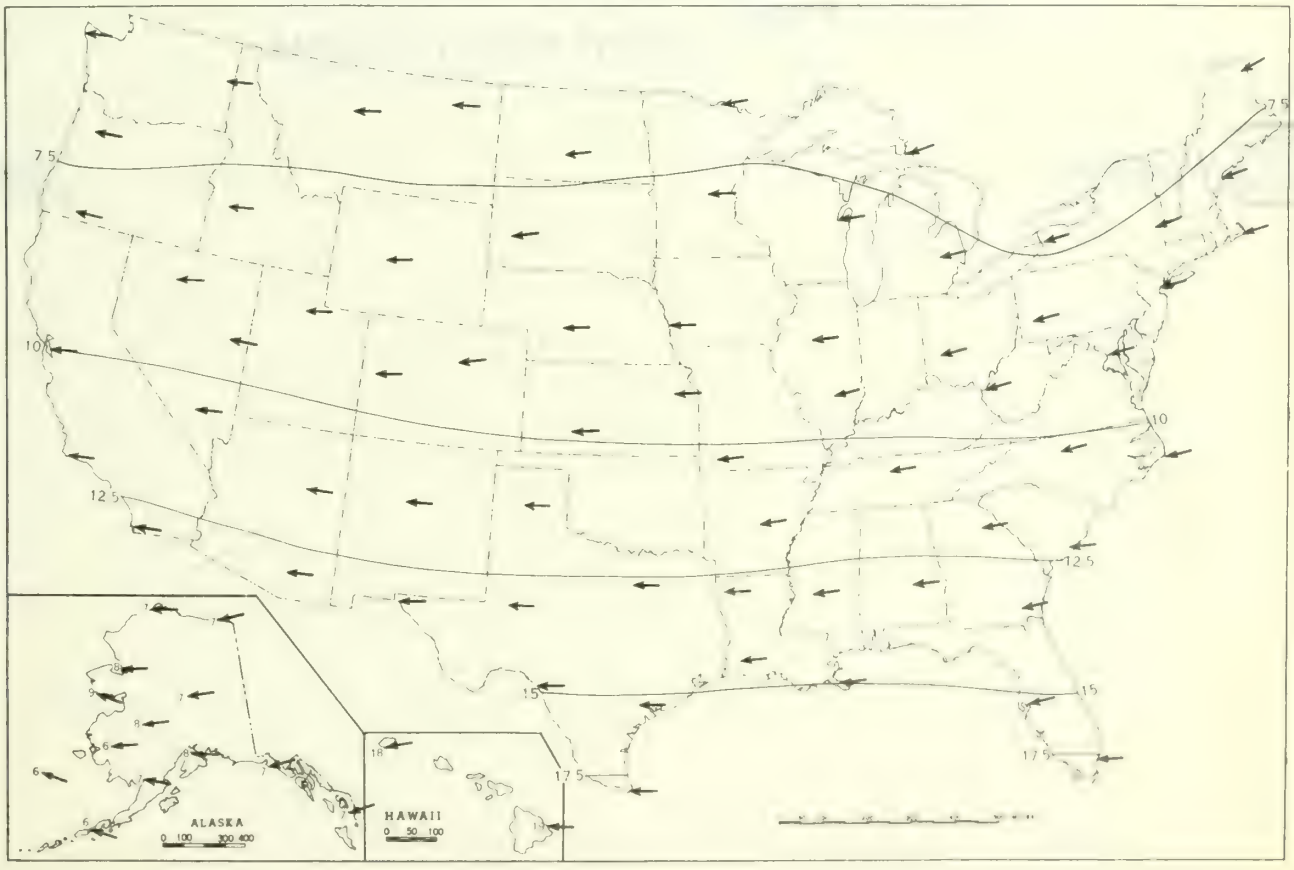


Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV 200-mb. Surface, 1200 G.m.t., June 1971. Average Height and Temperature, and Resultant Winds

Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI 100-mb Surface, 1200 G.m.t., June 1971. Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 G.m.t., June 1971. Resultant Winds.

B. 30-mb. Surface, 1200 G.m.t., June 1971. Resultant Winds.

Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 22 No. 7 JULY 1971

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. July was exceptionally cool over the Great Plains and the Great Lakes Region and hot over the Southwest.
2. Afternoon and evening thunderstorms brought most of the rain.

TEMPERATURE--July was a cool month over most of the Nation. At Dubuque, Iowa, the monthly average temperature was 68°. This was the coolest July at Dubuque in 120 years. At Erie, Pa., it was the coolest July in 80 years. In parts of North Dakota, July 1971 was the coolest July in more than half a century and at Nashville, Tenn., it was the coolest July in 20 years. In contrast, the temperatures at Providence, R. I., averaged 74°, the warmest July average in 16 years. Parts of Arizona also experienced the warmest July of record--Phoenix with an average temperature of 95° and Winslow where the temperatures averaged 83°. Record maximums and minimums also occurred in other parts of the Nation. At Spokane, Wash., the temperature on July 7 dropped to 38°, the lowest July minimum in 91 years. On the same date, Yakima, Wash., registered 34°, the lowest July minimum in the 62-year record. Oklahoma City, Okla., and Fort Smith, Ark., recorded 53° on the 31st. These are record lows for July at those stations. Among the other locations that experienced record low July temperatures near the end of the month were: Huron, S. Dak., 37°; Valentine, Nebr., 38°; Grand Island, Nebr., 42°; Norfolk, Nebr., 42°; Omaha, Nebr., 45°; Lincoln, Nebr., 46°; Burlington, Iowa, 46°; Des Moines, Iowa 47°; and Kansas City, Mo., 52°. At Agate, Nebr., the temperature fell to 29°, the coldest July temperature of record for the entire State.

Although the temperatures over the Great Plains in the last half of July resembled those generally experienced in early autumn, the Far Southwest found July heat especially oppressive because of the unusually high relative humidity which prevailed.

PRECIPITATION--Typical summer thunderstorms produced most of the rain that fell in July. Most of the thunderstorms brought beneficial showers. A few were accompanied by damaging hail, strong winds, or torrential flood-producing downpours. A station near Harlan, Nebr., received 6.75 inches of rain on July 3. An outbreak of severe thunderstorms occurred in the Upper Mississippi River Valley on July 12. Winds in the Rochester, Minn., vicinity gusted to 87 m.p.h., blew a bus off the road, and downed trees and powerlines. Tornadoes occurred at scattered locations in Iowa on the 12th. Light to heavy showers fell over portions of the Missouri and Ohio River Valleys, in the Northeast, and parts of the Southeast on July 16.

Afternoon and evening thunderstorms occurred in parts of the Corn Belt in the third week of July. The drought intensified in Texas. Duststorms occurred in some dry areas. More thundery weather occurred over the Southeast in the last week of the month. These storms occurred along the leading edge of an advancing mass of polar air and in the warm, humid air ahead of the front.

Monthly precipitation totals ranged widely from less than 1 inch over most of the West to over 8 inches in spots in the central Great Plains and the Southeast. Precipitation over the Corn Belt ranged from 1 inch to more than 5 inches.

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATES

JULY 1971

\+ And also on an earlier date or dates.

NOTE: Dates in the above table apply to the period 24 hours prior to time of observation. In some cases the actual occurrence is on the calendar date preceding that shown. (See individual Climatological Data for times of observations).

D Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of snowfall.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70 F or above for Alaskan Stations.
Y Peak Gust
+ And also on an earlier date or dates
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month

Wind directions under resultant direction are in tens of degrees

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table

Includes crop damage.
C Crop damage.
* No occurrence of storms or unusual weather phenomena reported.
‡ Includes heavy sleet storm.
Freezing drizzle and freezing rain, commonly known as glaze.
Ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5 Million
7 $5 Million to $50 Million
8 $50 Million to $500 Million
9 $500 Million to $5 Billion.

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS
JULY 1971

Elmer R. Nelson, Office of Hydrology

Numerous flash floods were reported throughout the nation during July. The most damaging flash floods occurred in central and eastern Kentucky during the middle of the month. Flood damages were estimated in excess of $3.3 million. The threat to Cave Run's Coffer Dam necessitated the evacuation of 1,500 people from their homes.

Major flooding occurred in the Nueces Basin in Texas during July. The crest of 25.7 ft. at Cotulla, Tex., ranked as the third highest of record.

ATLANTIC SLOPE DRAINAGE

All major water supply reservoirs in New Jersey decreased storage in July. Some reservoirs recovered as much as a half billion gallons near the end of the month due to heavy rains. The 13 principal reservoirs in New Jersey decreased storage by 8.4 billion gallons or about 12 percent of capacity. New York's three reservoirs on the upper Delaware decreased storage by 51.1 gallons or 21 percent of capacity.

Heavy thunderstorm activity on July 29 in the Washington, D. C., metropolitan area caused a flash flood on Four Mile Run in Alexandria, Va. The Corps of Engineers estimated the damage at $100,000.

Heavy thundershowers on July 2 caused flash flooding in urban areas of Columbia, S. C. Flood damage was estimated at $85,000 which is the highest in several years. This flash flooding was due to 3.5 inches of rain that occurred in less than 1 hour. Flash flooding occurred at Moncks Corner, S. C., during the evening of July 28 due to 4.55 inches of rain within a few hours. A creek which runs through the town overflowed its banks for several hundred yards. Water covered a highway to a depth of 1 foot for several hundred feet, but was passable. Minor damage was reported. Over 4 inches of rainfall over the headwaters of the Edisto Basin during the last 3 days of the month caused the North Fork to rise above flood stage at Orangeburg, S. C., on the 31st. It was almost 1 foot above flood stage late on the 31st and still rising.

EAST GULF OF MEXICO DRAINAGE

Locally heavy showers caused flooding along Peachtree Creek in Atlanta, Ga., on the 30th. It crested 3.2 ft. above flood stage during the evening of the 30th.

Shower activity was widespread in Mississippi during July. Monthly totals ranged from near 2 inches in De Soto County to 17 inches at Jackson County Fire Tower. Streams and rivers rose moderately as the precipitation increased. All rivers remained within their banks except the Pearl River in the vicinity of Jackson, Miss., which rose above flood stage for a short period at the end of the month.

Heavy thundershowers at Laurel, Miss., on the 27th caused flash flooding in the eastern areas of the city. The rainfall totalled 3.83 inches in 2 hours. Seventy-five to 80 families were evacuated by Civil Defense from the low areas of the city which is subject to flooding from the Tallahoma and Tallahala Creeks. Water in low areas rose to a depth of 4 ft. Damage was estimated at around $500,000 by Civil Defense. Minor flash flooding occurred elsewhere in Mississippi but was of short duration and of little consequence.

MISSISSIPPI SYSTEM

Upper Mississippi Basin--Heavy rain on the 10th caused flash flooding on Geneseo Creek at Geneseo, Ill., during the evening of the 10th and the morning of the 11th. Extensive damage resulted to commercial and private property. The rainfall totalled more than 5 inches in less than 3 hours.

Missouri Basin--Lowland flooding occurred in the upper portions of the Little Sioux River in Iowa from the 6th to the 8th. This flooding was due to 1 to 3 inches of rain over northwest Iowa during the night of the 3d. Recurring rains of near 1 inch during the following week kept the Little Sioux at near bankfull stages in the upper reaches until about the middle of the month. A crest of 11.98 ft. was observed at Linn Grove, Iowa, on the 12th.

Snowmelt from the higher elevations of the Rocky Mountains and rainfall from storm systems across the Platte River Basin in Nebraska kept the Platte River above flood stage near Grand Island, Nebr., from May 5 to July 1.

Heavy rains ranging from 2 to 7 inches caused flooding on the Little Platte, Fishing, and Platte Rivers in northwest and west-central Missouri on the 10th-11th. The crest on the Little Platte River at Smithville, Mo., was nearly 8 ft. above flood stage on the 11th. The Platte River from Agency, Mo., downstream was bankfull, but no significant flooding resulted. The Crooked River at Richmond, Mo., rose to around bankfull stage.

General to locally heavy rains of 3 to more than 5 inches from north-central through east-central Kansas on the 3d, 4th, and 22d caused mostly localized agricultural overflow. The heaviest flooding occurred on Lyon Creek, a tributary of the lower Smoky Hill River, which crested 10.3 ft. above flood stage near Woodbine, Kans., on the 23d. It crested nearly 5 ft. above flood stage on the 5th. Minor agricultural flooding occurred on the lower Republican River, and the Solomon River just above Waconda Lake, and Buffalo Creek, between the 3d and 5th. Minor flooding occurred on the upper Marais des Cynes River above Melvern Reservoir, and on Pattawatomie Creek on the 23d and 24th. Losses were generally light.

Ohio Basin--A flash flood occurred in the left fork area of Tupplers Creek, about 10 miles north of Charleston, W. Va., near Sissonville on the 11th. The flooding was confined to a small area about 8 miles in diameter. The flash flooding was due to locally heavy rains that occurred between 4:30 p.m. and 9:15 p.m. on the 11th. Twelve bridges were washed out and some roads were damaged. Many houses and cars were flooded.

Flash flooding occurred in Elliott County, Kentucky, in the Little Sandy River Drainage during the night of the 17th-18th. Several creeks were flooded in the vicinity of Sandy Hook, Ky., Isonville, Ky., Newfoundland, Ky., Bruin, Ky., and Sandy Hook, Ky. Damage to crops was estimated at $1 million. Other damage was estimated at $65,000.

A flash flood occurred in West Virginia, in Boone and Lincoln Counties, on the 18th. Part of the area drained into the Coal River and part into the Mud River. Flooding occurred on the left fork of Mud River in vicinity of Yawkey, W. Va. The heavy rain began about 10 a.m. and lasted about 50 minutes. This storm also covered adjoining areas in Boone County, on Little Horse Creek and Camp Creek. According to Civil Defense, about $90,000 damage occurred in Boone County and about $52,000 in Lincoln County.

Locally heavy rain caused some flash flooding in Greenup County, Kentucky. Some damage resulted to crops along Lost Creek, Little Sandy River, and East Fork in Greenup County. Damage was estimated at

$2,000 by the County Agent.

A flash flood occurred during the afternoon of the 19th on Grasslick Run at Fairplain, W. Va. Considerable damage resulted to streets, bridges, and growing crops. According to the County Agricultural Extension agent, 100 basements were flooded. Damage was estimated at $330,000.

Intense rain between 6 and 7 p.m. on the 21st, caused a flash flood on Arbuckle Creek in the Oak Hill-Minden-Minersville, W. Va., area. Approximately 50 to 75 homes had water in basements. Damage was estimated at $8,000.

Heavy rain of 3 to 4 inches on the 19th over the Muscatatuck Basin in southeast Indiana caused flooding at Austin, Ind., on the 19th-20th. The crest on the 19th was 2.3 ft. above flood stage.

Heavy rain and damage from flash flooding was widespread over central and eastern Kentucky between the 18th and 22d. The total damage in Morgan, Bath, Rowan, McGoffen, and Carter Counties was estimated in excess of $3.3 million. Damage to highways and bridges was estimated around $1 million. The threat to Cave Run's Coffer Dam necessitated the evacuation of 1,500 people from their homes in Bath and Rowan Counties. Flash flooding forced the evacuation of around 50 homes in Morgan, Carter, and McGoffin Counties.

Heavy rains produced minor flooding along the Cache River below Ullin, Ill., early on the 24th. The heaviest rain occurred in the Olive Branch-Horseshoe Lake area, where it is estimated that the amounts ranged from 5.5 to 8 inches.

White Basin--Heavy rains of 3 to 4 inches on the 23d and 24th caused flooding on the Cache River at Patterson, Ark., beginning on the 26th. The crest on the 27th was 0.5 foot above flood stage. The flooding continued into August.

Stages on the White River below Bull Shoals Reservoir were low during July due to lack of precipitation. The low stages interfered with barge traffic on the White. There were reports of fish kills due to increased temperature of the water at low stages.

Arkansas Basin--Heavy thunderstorm activity over southern Lincoln and northern Crowley Counties in Colorado on the 13th caused some flash flooding from normally dry arroyos along and adjacent to State Highway 71. The Colorado State Police reported some flooding west of La Junta, Colo.

Heavy rainfall on the 4th and 5th caused flooding along the lower portion of the Cottonwood River in Kansas from the 5th to the 8th. The crests ranged from slightly over flood stage at Cottonwood Falls, Kans., to 5.3 ft. over flood stage at Plymouth, Kans.

WEST GULF OF MEXICO DRAINAGE

Heavy rain over the upper Trinity and upper Brazos River Basins during the latter part of July caused some flash flooding. Changes in reservoir levels were minor since general rainfall accumulation was distributed over several days.

Flash flooding occurred in the south portion of Tarrant County, Texas, on the 28th-29th. A 4-inch rain in a 6-hour period on the 29th resulted in 25 to 30 flooded basements in the southwest portion of Fort Worth, Tex.

Heavy rains on the 24th-25th caused minor flooding on Leon River and Cowhouse Creek in central Texas on the 25th. The Leon River crested at Gatesville at 26.83 ft. on the 25th and Cowhouse Creek at Pidcoke, Tex, at a stage of 19.3 ft. on the same date.

Flooding occurred on the San Saba River at San Saba, Tex., on the 26th-28th. Lesser flooding occurred on the Llano River in Llano County on the 26th. The total rainfall causing these floods ranged from 4 inches to near 12 inches at Brady, Tex.

The flooding on Turkey Creek and the Nueces River in Texas in the beginning of the month was due to heavy rain on June 26-27. Harrison Ranch reported 13.75 inches and Light Ranch, 8.90 inches of rain in 24 hours. Flood crests of around 10 ft. above flood stage occurred on the 1st and 2d at the Turkey Creek Junction with the Nueces at Crystal City, Tex., and on the Nueces at Asherton and Cotulla, Tex. Major flooding occurred at Cotulla with a crest of 25.7 ft. (flood stage 15 ft.) ranking as the third highest of record. Extensive flooding occurred near Tilden and Three Rivers, Tex., from the 2d to the 15th. The crests on the 5th and 7th ranged from 9 to 15 ft. above flood stage. Lake Corpus Christi rose to the top of Wesley Seale Dam and began spilling over on the morning of the 9th. Extensive flooding moved rapidly down river below the dam, with flood stage reaching Calallen, Tex., on the 11th. Extensive flooding occurred through the 16th. Two boys were drowned on the 11th, one fishing below Wesley Seale Dam, and the other wading near Calallen, Tex. The water fell below flood stage on the 19th. Flood damage along the middle Nueces River was mostly to irrigation pumps, pump houses, and farm machinery. Damage along the extreme lower Nueces below Corpus Christi to Nueces Bay was mostly to seasonal dwellings. The total flood damage was estimated at $58,000.

Flash flooding occurred in the El Paso, Tex., metropolitan area on July 2. Considerable flooding of streets, arroyos, and drainage ditches occurred. Damage to private dwellings and lawns due to erosion and mud deposition was widespread, but, in most cases, fairly low in dollar cost. One death resulted. Damage was estimated at $95,000.

GREAT BASIN

Locally heavy thunderstorms caused flash flooding in a few areas of south-central Utah and in southwestern Colorado from the 19th through the 22d. The local flooding in Salt Lake City, Utah, during the evening of the 19th was due to 0.75 inch of rain that occurred in 1 hour. East of Paonia, Colo., heavy rain caused mud and rock slides that covered railroad tracks and blocked irrigation canals. Two buildings and a vehicle were washed down an embankment.

Heavy local thunderstorms caused flash flooding in the Reno, Nev., area on the 16th and 31st. Considerable property damage resulted from the first storm.

PACIFIC SLOPE DRAINAGE

Columbia Basin--Streamflow in the upper Columbia and Kootenai Basins reached the highest seasonal flow in late July but was controlled by reservoir storage. Consequently, flow in the lower Columbia River at Bonneville, Oreg., receded from 400,000 c.f.s. on July 1 to 200,000 c.f.s. at the end of the month. The stage of the Columbia River at Vancouver, Wash., was slightly over 15 ft. (flood stage, 16 ft.) on July 1. It continued to recede through the middle of the month and held fairly stationary except for tidal fluctuations through the 27th. The stage at the close of the month was near 5 ft. The average stage for Vancouver, Wash., for July was 9.4 ft. or 2.8 ft. above the long term monthly normal stage.

PUGET SOUND DRAINAGE

Warm weather beginning on the 13th caused rapid

melt of the heavy snowpack in the upper Skagit River Basin. The river rose to 1 to 2 ft. below flood stage at Concrete and Mt. Vernon, Wash., on the 22d, but no overflow was reported.

ALASKA

Major rises were observed on three different river systems in Alaska during July. The rise on the Tanana River in south-central Alaska resulted almost entirely from high elevation snow and glacier melt. Heavy rains during the middle of the month were the major causes of the other rises. However, streams in Alaska are usually at their highest baseflow levels during this time of the year due to high elevation snow and glacier melt.

The Kuskokwim River crested 1 ft. below flood stage at Nikolai on July 1. Heavy rainfall in the White Mountains northwest of Fairbanks caused a rise on the Chatanika River to near bankfull stage on the 13th. The Tanana River crested 0.5 ft. below flood stage at Big Delta on the 15th and at flood stage at Nenana on the 16th. The Chisana River crested just below bankfull level on the 17th. No damage resulted from the high water in Alaska during July.

The U. S. Geological Survey reported the monthly mean discharge for the Kenai River at Cooper Landing as the second highest July in 24 years of record and 140 percent of the median.
